1. Overview

1.1. Introduction

1.1.1. API Introduction

The secure and comprehensive API provides a single point of integration with multiple business systems that require information and use functionality exposed by the product, the underlying managed network and related products that are enabled by the core.

The REST-based API covers all functionality provided by the product and includes a comprehensive JSON-based schema with schema rules, metadata and data that simplifies integration.

Refer to the API Guide for more information on integrating with the VOSS Automate API.

For a reference of the schema and the operations applicable for each resource in the system, refer to the relevant API Reference. Resources are classified by the type of model in the system (data, device, domain, relation or view), for example data/AccessProfile, device/cucm/Phone, and so on. Depending on the installed modules and their feature packages, the API of feature package models may be available, for example relation/Subscriber, view/QuickSubscriber, and so on.

The product is fully integrated with external LDAP directories and SAML identity providers, allowing users to utilize existing identity management system to provide seamless access to portals developed using the product.

Note: References to HCM-F and Shared Data Repository (SDR) are only relevant if installed.

1.1.2. API System Concepts

To understand the API, it's important to understand two basic concepts

- · Models
- Hierarchy

"Model" describes the types of JSON objects fulfilling purposes such as defining data structures, containing data, defining GUI forms, mapping data from devices or other models.

The system employs the following types of models:

- · Data Models
- · Device Models

- · Domain Models
- Relations
- Views

Data in the system is represented using Data models and Device models.

Device models are generated from the application API of entities that are provisioned on devices.

Domain models, relations and views wrap the Data or Device models by means of references to them.

Data models can be created and are stored in the database. Data models contain a JSON schema/metadata for the entities exposed by the underlying database. The schemas for the data models are stored in the database and represent the structure that instances of the data model conforms to.

Device models interface with devices and services on the system. For example:

- Unified CM device models interface with the Call Manager's AXL SOAP API.
- · CUC device models interface with Unity Connection's RESTful API.

The ability to rapidly develop and deploy new device interfaces provides an extensible mechanism to add support for additional provisioning tasks or additional southbound integration into other business systems. Domain models act as "containers" of other data-, device- and domain models along with provisioning workflows to represent the management of a created feature.

Relations do not store data on the system. Instead, they relate groups of resource types such as device models, data models or other domain models.

Views provide a mechanism to define an arbitrary schema, which can be used to define a user input screen.

1.1.3. Hierarchy

A system hierarchy node is present at first startup of the system.

Each entity attached to the hierarchy has an address, represented by a pkid, which is defined as a standard URI.

Hierarchies can be created under the system hierarchy node, because the hierarchy is exposed as a RESTful API. API calls are made with reference to the hierarchy.

1.1.4. Basic REST

The system uses a REST (Representational State Transfer) API.

For more information about this type of API, see http://en.wikipedia.org/wiki/Representational_state_transfer

1.1.5. API Traversal

The system represents the reference of an entity in the system as Hypermedia as the Engine of Application State (HATEOS). Each reference position is represented by an object pair pkid and href.

A client integrates with VOSS Automate entirely through hypermedia dynamically provided by the VOSS Automate application and does not need any prior knowledge about how to interact with the system other than a generic understanding of hypermedia. This means that no WADL is provided. This also means that the client and VOSS Automate can be decoupled in a way that allows VOSS Automate to evolve independently.

A client enters the VOSS Automate through a simple fixed URL. All future actions the client may take are discovered within resource representations returned from the server

The detailed URL tree endpoint information is available in the relevant API Reference Guides for the core and features.

This response emulates the HierarchyNode list response, and utilizes the parent and children in the meta references section of the response, as discussed in Meta Data References.

1.1.6. Request and Response Patterns

The request and response patterns between service requester and VOSS Automate is summarized below. For details, refer to the topics in the chapter called *Anatomy of an API Response*.

For synchronous operations:

- 1. Service Requestor sends a accessor (e.g. Get, List) request with request parameters to VOSS Automate.
- 2. Either:
 - a. VOSS Automate responds synchronously with a Get/List response.
 - b. VOSS Automate responds synchronously with a fault response.

For asynchronous operations:

- 1. Service Requestor sends a mutator (e.g. Add, Modify, Delete) request with parameters.
- The Add/Update/Delete transaction is scheduled on the VOSS Automate transaction queue with a transactionID.
- 3. VOSS Automate responds synchronously with either:
 - a. An Add/Update/Delete response and a transactionID.
 - b. A fault response.
- 4. The external system either:
 - a. Polls the system to retrieve the status of the transaction as needed, or
 - b. Specifies a callback URL (with an optional username and password if the interface is secured (recommended)) and waits for a asynchronous transaction status callback (recommended).
 - When the transaction completes, VOSS Automate sends an async transaction status callback message to the callback URL specified in the request.

1.2. Anatomy of an API Request

1.2.1. General Structure of the API

The VOSS Automate API accesses system resources or tools.

Resources

The general structure of an API URL for accessing a system resource (an endpoint) is:

Method https://servername/api/Resource/Action/?Parameters

Where:

Method

[GET | POST | DELETE | PUT | PATCH]

Servername

The installation server determines the base URL, e.g. https://servername. In a cluster environment, this is the address of the web proxy node. Refer to the Install Guide for cluster deployment information.

api

A static string in the URL that is a part of the endpoint.

Resource

(str:modeltype/str:modelname)[/pkid]

Refer to the relevant API Reference guides for a list of supported resources.

Action

For a complete list of actions supported for resources in the system and for a list of custom actions, refer to the relevant API Reference Guides.

Parameters

[(str:api parameter)[&(str:api parameter)...]]

The HTTP methods and parameters are described in relevant sections. The different resources supported in the system are described in the API Reference Guides.

Tools

The general structure of the URL structure for Tools is, for example:

[GET|POST] /api/tool/(str:tool_name)/

1.2.2. Format

The system API supports the following format HTTP headers when handling and responding to requests.

| Field Name | Description | Value |
|------------------|--|---------------------------------|
| Content- Type | The format type of the body of the request (used with POST and PUT requests) | application/json |
| Content- Type | The format type of the body of the request (used with PATCH requests) | application/json- patch+json |
| Accept | Content-Types that are acceptable in response | application/json |

1.2.3. Authentication

The system controls access to its service through HTTP basic authentication. The technique is defined in section 11.1 of RFC1945, which is simple to implement, and uses standard HTTP headers.

The HTTP Basic Access Authentication requires authorization credentials in the form of a user name and password before granting access to resources in the system. The username and password are passed as Base64 encoded text in the header of API requests.

The HTTP header format for authentication is defined in the table below.

| Field Name | Description | Value |
|---------------|------------------------------------|------------------------------------|
| Authorization | Basic authentication is supported. | Basic [Base64 encoded credentials] |

Example:

The Base64 encoded credentials for user name of joe and a password of bloggs.

For example, from a command line (note the removal of the new line in the echo command):

```
$ echo -n "joe:bloggs" | base64
am910mJsb2dncw==
```

the header will be:

Authorization: Basic am910mJsb2dncw==

For example, using **curl**:

```
curl -k -H "Authorization: Basic am910mJsb2dncw=="
   'https://hostname/api/data/MyModel/'
```

It is required that all requests be conducted over a secure session, such as HTTPS or SSL.

A VOSS Automate self-signed certificate needs to be installed into a local trust store of the client application.

1.2.4. Authorization

A user's access profile determines whether they can perform a given operation on a model. The user can also only access items below the position they are defined in the hierarchy.

1.2.5. HTTP Methods

The API supports the following HTTP methods:

GET

· Used to query a resource or a list of resource.

POST

- · Used to create a new resource.
- · The data is submitted as a JSON object.
- The return value is the pkid of the resource.

PUT

- Used to update the data of a resource.
- The resource URL includes the resource pkid.
- The data to be updated is submitted as a JSON object.

PATCH

- Used to update the data of a resource.
- · PATCH request body in JSON Patch format
- · Content-Type is "application/json-patch+json"
- JSON Patch: http://tools.ietf.org/html/rfc6902

DELETE

- · Used to delete a resource.
- The resource URL includes the resource pkid.
- The DELETE method can also be used to delete multiple resources on one request as a "bulk delete".

1.2.6. PUT Versus PATCH

For PUT methods the resource data is replaced with the data specified in the request. All fields of the resource are replaced with the fields in the request.

This means that:

- Fields not present in the request that are present in the resource will be dropped from the resource.
- Fields present in the request that are not present in the resource will be appended to the resource.
- The data of fields present in the request is used to update fields that already exist in the resource.

PATCH methods operate in two modes depending on the content type:

• Content type: application/json The values of data fields present in the request is used to update the corresponding resource fields.

This means:

- Fields present in the request but not in the resource are appended to the resource.
- The value of each field that is already present in the resource is updated from the request data.
- Field values that are set to null in the request is dropped from the resource.
- Fields that are present in the resource but not in the request are left untouched.
- Content type: application/json-patch+json Existing resource data is patched according to RFC6902.

Modifying Data Fields

- To drop the field from a data model, specify null as the parameter value (i.e. {"field": null}).
- To blank out a string value set the parameter value to an empty string (i.e. {"field":""}).

API Parameters 1.2.7.

Note: VOSS Automate will not support API Backward Compatibility from release 21.1 and future releases. From release 21.1 forward, the following must be removed from API requests.

- API parameter: api_version=<version_number>
- Request header: X-Version:version_number>

The hierarchy parameter is required for each API request and can be specified as any of the following:

- the pkid of the hierarchy node in the form of a UUID, for example 1c055772c0deab00da595101
- in dot notation, for example ProviderName.CustomerName.LocationName

To obtain the pkid of a hierarchy node, refer to the path element in the metadata of data/HierarchyNode resource.

For the purposes of simplifying the documentation, the hierarchy API parameter &hierarchy=[hierarchy] is not included in all examples in this document. Specifying the hierarchy is however required in all API requests where the instance pkid is not referenced. In the examples, [hierarchy] is substituted with the caller's hierarchy id.

Format

The system API supports the following request parameters for data format when handling requests.

| Key | Description | Value |
|--------|--|-------|
| format | The format type of the body of the request | json |

A request of the following format returns HTML:

```
GET /api/(str:model_type)/(str:model_name)/help/
```

A parameter &format=json is not displayed in all examples, but it is required for all requests unless a different format is specifically stated.

Configuration Template and Template Name

The Configuration Template can be specified in the POST request parameters for a resource as follows:

| Key | Description | Value |
|---------------|---|------------|
| template | Apply the Configuration Template with pkid [CFG pkid] to the payload of the POST request. | [CFG pkid] |
| template_name | Apply the Configuration Template with name [CFG name] to the payload of the POST request. | [CFG name] |

Field Display Policy

Field Display Policy can be specified in the GET request parameters for a resource as follows:

| Key | Description | Value |
|-------------|---|------------|
| policy | Return a model form schema where the Field Display Policy with pkid [FDP pkid] is applied to it. Use policy with the parameters schema and format=json. | [FDP pkid] |
| policy_name | Return a model form schema where the Field Display Policy with name [FDP name] is applied to it. Use policy with the parameters schema and format=json. | [FDP name] |

Cached

The API can return cached data from the system or data from devices, using the following format:

| Key | Description | Value | Default |
|--------|--|-------------|---------|
| cached | System will respond with resource information where the data was obtained from cache. (Functionally only applicable to device models and domain models containing device models) | true, false | true |

Note: From 11.5.2 onwards, the API URL cached parameter on the Subscriber list (/api/relation/Subscriber/) will not be honoured. Data presented to the API will always display cached information and will not refresh the information from the device during a list guery with cached=false.

Resource instance

To identify a single resource, the API call contains the single resource (pkid) using the following format:

Schema and Schema Rules

To obtain the schema or schema rules of a resource, use the following parameters to an API request:

| Key | Description | Value |
|--------------|---|-------------|
| schema | Return the schema of the resource. Use with the parameter format=json | true, false |
| schema_rules | Return the GUI Rules and Field Display Policies of the resource if available. Use with the parameters format=json and schema to see schema_rules in the response. | true, false |

9

List pagination

The system API supports the following two tables of API request parameters when specifying the format of and structure of the resources to list.

· Pagination parameters

| Key | Description | Value | Default |
|-------|--|-------------|---------|
| skip | The list resource offset. If the Range request header is used, it will override this parameter. | | 0 |
| limit | The maximum number of resources returned. The maximum value is 2000. If the Range request header is used, it will override this parameter. | 1-2000 | 50 |
| count | Specify if the number of resources should be counted. If false, the pagination object in the response shows the total as 0, so no total is calculated and the API performance is improved. | true, false | true |

List format

· List format parameters

| Key | Description | Value | Default |
|-----------|--|----------------------|-------------------------|
| order_by | The summary attribute field to sort on | | First summary attribute |
| direction | The direction of the summary attribute field sort (asc:ascending, desc: descending) | asc, desc | asc |
| summary | Only summary data is returned in the data object | true, false | true |
| traversal | The direction of the resource lookup of resources tied to the hierarchy tree from the hierarchy node provided as parameter | up, down, lo- cal | down |

Note: From 11.5.2 onwards for api/relation/Subscriber:

- The API URL summary parameter on the Subscriber list (/api/relation/Subscriber/) will not be honoured. Data presented to the API will always display summarized information and will not display full CUCM User data with summary=false.
- The API parameter traversal=up on the Subscriber list (/api/relation/Subscriber/) will not be honoured. Data presented to the API will default to display resources down the hierarchy tree with traversal=up.

Filter

Models that have the list action defined in their schema can also be filtered by using a number of URL filter parameters in parameter sets of four key-value pairs.

Filters also apply to the api/tool/Transaction/ endpoint, which has additional filter functionality to filter by transaction ID. Refer to the topic on Filter Transactions.

These parameters can be added in addition to the parameters available to list resources as in the topic on API Parameters.

A single filter query can contain one or more sets of the following four parameters:

| Key | Description | Value | Default |
|------------------|---|--|----------|
| filter_field | The model attribute name to filter. | The name of the attribute in the list of summary_attrs in the model schema. | |
| filter_condition | The matching operator for the filter_field. If equals is used in a condition, then other filter sets are ignored. | One of the conditions below, applied to a filter_text string value. • startswith • endswith • contains • notcontain • equals • notequal | contains |
| filter_text | A text string applied to the filter_field by a filter_condition. | Plain text | |
| ignore_case | Additional specifier applied to the case of the filter_text. | Either true or false. | true |

Example showing a single filter set:

```
GET /api/(str:model_type)/(str:model_name)/?
hierarchy=[hierarchy]
&filter_field=[attribute_name]
&filter_condition=startswith
&filter_text=John
&ignore_case=false
```

Note: For relation/Subscriber, the list of filter_field values are restricted to:

- userid
- firstname
- lastname
- mailid
- hierarchy_friendly_name

- device
- extension_mobility
- phone

If more than one filter set is used, all similar keys are grouped, so that the key position indicates the filter set. For example:

```
GET /api/(str:model_type)/(str:model_name)/?
hierarchy=[hierarchy]
&filter_field=[attribute_name]
&filter_field=[attribute_name2]
&filter_condition=startswith
&filter_condition=endswith
&filter_text=John
&filter_text=an
&ignore_case=false
&ignore_case=false
```

The two filter sets in this example, are:

- &filter_field=[attribute_name]
- &filter_condition=startswith
- &filter_text=John
- &ignore_case=false

and

- &filter_field=[attribute_name2]
- &filter_condition=endswith
- &filter_text=th
- &ignore_case=false

Synchronous and Asynchronous

It is possible to submit mutator type operations with API parameters to complete synchronously, in which case the synchronous response to the transaction either includes the status of the transaction or a fault response. This is not recommended as long-running transactions or a busy system may exceed the HTTP timeout.

This is only available for models where the actions in the meta data contains support_async.

| Key | Description | Value | Default |
|--------|--|-------------|---------|
| nowait | Controls the API synchronous or asynchronous behavior for requests resulting in transactions. Please refer to the support_async property in the model schema under meta -> actions, for an indication of support per action. | true, false | false |

Tags

To manage (add, remove) tags of a resource instance where the resource operations permissions allows tag management.

| Key | Description | Value |
|-----|--|--|
| tag | Applies to resource instance (<instance_pkid>)</instance_pkid> Uses +tag in URL Resource operation enables Tag API call is PATCH on resource instance | <tag_value> See below.</tag_value> |

<tag_value> can be:

- 1. a tag name (no capital letters if tag should be searchable).
- 2. __CLEAR_TAG__<tag_name> to remove a tag <tag_name>.
- 3. __CLEAR_ALL_TAGS__ to remove all tags.

```
PATCH /api/(str:model_type)/(str:model_name)/<instance_pkid>/+tag/?
hierarchy=[hierarchy]
&tag=<tag_value>
```

Note: More than one tag parameter may be used, for example &tag=tag_one&tag=tag_two...

Example JSON export of meta object of an instance showing:

- tags: "mytag", "another_tag"
- version_tag: "1.2"

Version Tags

To manage (add, remove) tags of a resource instance where the resource operations permissions allows tag management.

| Key | Description | Value | |
|-------------|--|---|---------|
| version_tag | Applies to resource instance (<instance_pkid>)</instance_pkid> Uses +tag_version in URL Resource operation enables Version Tag API call is PATCH on resource instance | <pre><version_tag 1.1,="" 1.2<="" example="" for="" pre=""></version_tag></pre> | _value> |

```
PATCH /api/(str:model_type)/(str:model_name)/<instance_pkid>/+tag_version/?
hierarchy=[hierarchy]
&version_tag=<version_tag_value>
```

Example JSON export of meta object of an instance showing:

- tags: "mytag", "another_tag"
- version_tag: "1.2"

1.2.8. Filter Parameters for Choices

For the context in which the filter parameter are used, refer to the Choices topic on the /choices/ endpoint.

```
GET http://<server_address>/api/<resource_type>/<resource_name>/choices/
?hierarchy=[hierarchy]
&format=json
&<filter_parameters>
```

Response data of the /choices/ endpoint *without* filter parameters is a list of value-title pairs of the business keys. This can be modified with filter parameters.

Example without <filter_parameters>:

Request

Format:

```
GET http://<server_address>/api/data/Countries/choices/
?hierarchy=[hierarchy]
&format=json
```

· Response

```
HTTP 200 OK
Vary: Accept
X-Request-ID: 9bcd77b4cd27dccd0f18a1d8d22e7ddab85aa848
Content-Type: text/html; charset=utf-8
Allow: GET, HEAD, OPTIONS
Response-Content:
{
   pagination : {
        direction: asc,
       maximum_limit : 2000,
       skip: 0,
       limit: 0,
        total_limit : ,
       total: 37
   },
   meta : {
        query : /api/data/Countries/choices/,
       references : [
           {
              pkid: 5a16c3c68963f91b84baf357,
              href : /api/data/Countries/5a16c3c68963f91b84baf357/
          },
        ]
    },
    choices : [
        {
            value : ["Australia", "AUS", "hcs"],
           title : ["Australia", "AUS", "hcs"]
        },
```

Filter parameters available to modify the response:

• field: specifies the field in the business key to return as title and value, for example adding the parameter below

```
&field=iso_country_code
```

would return:

(continues on next page)

(continued from previous page)

```
},
...
```

 choice_title: specifies the field of the business key to be the title value, for example adding the parameter below

```
&field=iso_country_code
&choice_title=country_name
```

would return:

• title: specifies the value of the field parameter to filter on, for example adding the parameter below

```
&field=iso_country_code
&title=BHR
&choice_title=country_name
```

would return:

Note that the title parameter matches on the *start* of the value.

• filter_condition: For an *exact* match, the &filter_condition=equals parameter can be added, for example:

```
&filter_condition=equals
&field=iso_country_code
&choice_title=country_name
&title=N
```

returns no value:

```
choices []
```

Without filter_condition=equals, in other words, with just:

```
&field=iso_country_code
&choice_title=country_name
&title=N
```

returns:

```
choices": [
   {"value": "NLD", "title": "Netherlands"},
   {"value": "NZL", "title": "New Zealand"}]
```

• filter_field and filter_text: the parameters are a field with value to filter on that is not the field parameter, for example to list only countries with emergency_access_prefix:911:

```
&field=iso_country_code
&choice_title=country_name
&filter_condition=equals
&filter_field=emergency_access_prefix
&filter_text=911
```

returns:

```
choices":[
{"value":"CAN","title":"Canada"},
{"value":"USA","title":"United States of America"}]
```

1.2.9. API Request Headers

Note: VOSS Automate will not support API Backward Compatibility from release 21.1 and future releases. From release 21.1 forward, the following must be removed from API requests.

- API parameter: api_version=<version_number>
- Request header: X-Version:<version_number>

API Headers are available for pagination of choices and macro results in an API call.

The headers are X-range and Range, with the starting value as 0. These override and can be used instead of the skip and limit API parameters.

For example, the following examples return the same results:

```
GET /api/tool/Macro/?method=evaluate
    &hierarchy=[hierarchy]
    &input={{fn.lines}}
    &skip=0
    &limit=6
GET /api/tool/Macro/?method=evaluate
```

(continues on next page)

(continued from previous page)

&hierarchy=[hierarchy]
&input={{fn.lines}}

Request headers:

X-Range: items=0-5
Range: items=0-5

If the request is items=0-199 (for 200 items) and there are more results, the response will show:

```
Content-Range:items 0-199/99999999
```

Since it is undetermined how many items there are, the value 999999999 represents the total.

In this example, we have a total of 298 items. if a subsequent request is for the next 200 items (200-399), this includes the total. The response will then also show the total number of items (298) returned by the macro:

```
Content-Range:items 200-399/298
```

Admin

All API requests for Automate Classic Admin GUI to the Automate API include the following headers:

```
REQUEST-PORTAL: Automate Classic Admin
```

PORTAL-TYPE: administration

All API requests for Automate Admin GUI to the Automate API include the following headers:

```
REQUEST-PORTAL: Automate Admin PORTAL-TYPE: administration
```

Self-service

All API requests for Self-service to the Automate API include the following headers:

```
REQUEST-PORTAL: Automate Self-service
```

PORTAL-TYPE: end-user

From a VOSS Automate API perspective, the headers are coming from Self-service. However, from a browser perspective, the user will not see the headers in browser developer tools, since Self-service requests are terminated by a Node.js server on the VOSS platform. The header injection is done in Node.js.

1.2.10. Login and Authorization Tokens

The API includes as part of responses a X-CSRFToken response header that is set to the CSRF token, for example to KEMzraBRygy2ZJ7fLuvbfKhAEIPK9D4s. API clients should source the CSRF token from this header.

For background on CSRF, see:

- · Cross-site request forgery
- Cross-Site Request Forgery (CSRF)

The API also includes as a part of responses a csrftoken cookie containing the CSRF token. This cookie is marked httponly and as such is not readable by browser-based client scripts. API clients should not try to source the CSRF token from this cookie.

The X-CSRFToken response header and csrftoken cookie values are identical.

When performing requests that require CSRF token validation, API clients should follow the general procedure:

- 1. Prior to performing the principal request, perform a request to the API and retrieve a CSRF token from the resulting response's X-CSRFToken response header. The CSRF token remains constant for the duration of a session, so clients could perform this request once per session (post authentication), storing the CSRF token and using it for subsequent requests.
 - Clients should also retrieve the csrftoken cookie from the response.
- 2. For the primary request, include a X-CSRFToken request header containing the CSRF token as sourced from the response header, as well as the unchanged csrftoken cookie.

Note: Cookies must conform to https://tools.ietf.org/html/rfc6265

Example for login:

```
GET http://localhost:8000/login/
Raw response headers:
Cache-Control: max-age=0
Connection: keep-alive
Content-Encoding: gzip
Content-Language: en-us
Content-Type: text/html; charset=utf-8
Date: Mon, 20 Apr 2015 09:18:47 GMT
Expires: Mon, 20 Apr 2015 09:18:47 GMT
Last-Modified: Mon, 20 Apr 2015 09:18:47 GMT
Server: nainx/1.4.6 (Ubuntu)
Set-Cookie: csrftoken=KEMzraBRygy2ZJ7fLuvbfKhAEIPK9D4s;
SameSite=Lax;
httponly;
Path=/
sessionid=5d1ccc96cbd7e7f290020aaedd64c1b3; httponly; Path=/
sso_login_url=; Path=/
Transfer-Encoding: chunked
Vary: Accept-Encoding, Cookie, Accept-Language, X-CSRFToken
X-CSRFToken: KEMzraBRygy2ZJ7fLuvbfKhAEIPK9D4s
```

- 1. Source the CSRF token from response's X-CSRFToken header.
- 2. Retain the CSRF cookie from response's csrftoken cookie.
- 3. Now perform the primary POST /login/ request to login, including the CSRF token as a X-CSRFToken request header as well as the unchanged csrftoken cookie:

```
POST http://localhost:8000/login/

Raw request headers:
Host: localhost:8000
User-Agent: Mozilla/5.0 (Macintosh; Intel Mac OS X 10.10; rv:37.0) Gecko/20100101

Firefox/37.0
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8
Accept-Language: en-US,en;q=0.5
Accept-Encoding: gzip, deflate
Referer: http://localhost:8000/login/
Cookie: sessionid=5d1ccc96cbd7e7f290020aaedd64c1b3;

Csrftoken=KEMzraBRygy2ZJ7fLuvbfKhAEIPK9D4s; sso_login_url=
Connection: keep-alive
X-CSRFToken: KEMzraBRygy2ZJ7fLuvbfKhAEIPK9D4s
```

With for example payload as parameters:

```
&username=joe
&password=bloggs
&next=%2F
```

Note: Anti-CSRF protection for Self-service is managed via the XSRF-TOKEN cookie and not the csrftoken cookie which is received on each request.

1.2.11. Non-interactive Login

The following request, parameter and endpoint is available on the API:

REQUEST:

```
POST <hostname>/noninteractivelogin/
```

PAYLOAD:

- Content-Type: application/json
- JSON containing user credentials, for example:

```
{
  "username":"joebloggs@email.com",
  "password":"mysecret"
}
```

PARAMETER:

A request parameter to expose hierarchy and role related data is available: rbacinfo

With the user credentials payload as above, the following calls result in the same response:

```
POST <hostname>/noninteractivelogin/
POST <hostname>/noninteractivelogin/?rbacinfo=false
POST <hostname>/noninteractivelogin/?rbacinfo=False
```

If the request is successful:

- the HTTP response is 200
- the JSON body is for example:

```
{
  "is_externally_authenticated": false,
  "last_successful_login_time": "2017-06-12T13:28:55.785Z",
  "num_of_failed_login_attempts": 0
}
```

X-CSRFToken VALUE

When enabling the rbacinfo parameter and with the same user credentials payload as above, the following calls result in the same response:

```
POST <hostname>/noninteractivelogin/?rbacinfo
POST <hostname>/noninteractivelogin/?rbacinfo=true
POST <hostname>/noninteractivelogin/?rbacinfo=True
POST <hostname>/noninteractivelogin/?rbacinfo=
```

If the request is successful:

- the HTTP response is 200
- the JSON body is for example:

```
{
    "hierarchy_path": "sys.Prov",
    "language": "en-us",
    "is_externally_authenticated": false,
    "hierarchy_name": "Prov",
    "hierarchy_href": "/api/data/HierarchyNode/593e8fa28719cf00060a7011/",
    "role_name": "ProvRole",
    "role_href": "/api/data/Role/593e91098719cf00060a7029/",
    "role_pkid": "593e91098719cf00060a7029",
    "last_successful_login_time": "2017-06-12T13:28:38.390Z",
    "hierarchy_type": "TestHierarchyNodeType",
    "hierarchy_pkid": "593e8fa28719cf00060a7011",
    "num_of_failed_login_attempts": 0
}
```

If a data/PrivacyPolicy instance is found at or above the logged in user's hierarchy, the data for the instance closest to that hierarchy will be included in the response JSON body:

(continued from previous page)

```
"name": "<Name from data/PrivacyPolicy>"
},
"hierarchy_path": "sys.Prov",
"language": "en-us",
...
```

Note:

- Upon the first successful login, the last_successful_login_time is an empty string.
- Upon a subsequent successful login, the last_successful_login_time is the login time prior to current session.
- The num_of_failed_login_attempts value is reset to 0 after a successful login.

If the requests above fail:

- the HTTP response is 403
- the JSON body is:

```
{
    "error_message": "Please enter a valid username and password.",
    "error_code": 27009
}
```

• the X-CSRFToken value

1.2.12. Access Profiles

A logged in user is associated with an Access Profile that specifies access permissions to operations and models.

A user's Access Profile may not apply to models that are included or referenced in for example GUI Rules, Wizards or models that provide choices.

For example, when API calls are made to models that contain choices, such as:

```
GET api/data/DataSync/add/?schema_rules=&schema=&format=json
```

then any model GET calls that are carried out to provide the list of choices are shown with a generated auth_token that is required to provide access to these GET calls. This can be seen in the returned schema, for example, for the target call to show the choices available for sync_order in data/DataSync ([hierarchy] is substituted with the GET caller hierarchy ID.):

```
sync_order: {
target: "/api/data/ModelTypeList/choices/?hierarchy=[hierarchy]&
  field=name&format=json&
   auth_token=[auth_token]"
title: "Synchronization Order"
description: "The selected 'ordered' model type list that was created
as a model instance of the Model Type List. This list dictates the
```

(continues on next page)

(continued from previous page)

```
order in which models will be synchronized. See: Model Type List."
format: "uri"
choices: [ ]
target_attr: "name"
target_model_type: "data/ModelTypeList"
type: "string"
```

This auth_token parameter is required to provide authorization to access the data/ModelTypeList, which may not be available in a user's Access Profile.

1.2.13. Time to Live (TTL)

For client applications that use session-based authentication upon initial login, an API endpoint that extends (if possible) and reports the session lifetime is available. This endpoint is typically used for client-side session management, for example to display a pop up to warn the user to extend the session before it expires (as in the case of for example self-service).

```
POST <hostname>/api/session/keep_alive/
```

The request returns a payload in JSON format with details:

- max_age: The number of seconds remaining for the session.
- · expiry: The date at which the session will expire.
- extendable: Boolean indicating if the client can extend the length of the session by triggering an API request.

An example response:

```
{
    max_age: 86296
    extendable: false
    expiry: "2015-03-18T10:24:53.059Z"
}
```

1.2.14. Account Endpoint

The <hostname>/account endpoint provides addiotnal endpoints:

- <hostname>/account/me/: returns user details
- <hostname>/account/password/: allows for password management

Logged-in User Details

The following request and endpoint is available on the API to return logged-in user details:

· Request:

```
GET <hostname>/account/me/?format=json
```

If the request is successful:

- the HTTP response is 200
- the JSON body contains user account details, as shown in the example snippet below:

```
"username": "CS-PAdmin",
"menu_layout": {
 "pkid": "5c7daa2a7579050013878f83",
 "href": "/api/data/MenuLayout/5c7daa2a7579050013878f83/",
  "name": "HcsProviderMenu"
},
"language": "en-us",
"landing_page": {
  "pkid": "5c7daa157579050013878d88".
  "href": "/api/data/LandingPage/5c7daa157579050013878d88/",
 "name": "HcsProviderLP"
"pkid": "5c7db7c5757905001387e6a1",
"account_information": {
 "password_last_change_time": "2019-03-05T00:54:27.277Z",
 "last_login_time": "2019-03-05T08:01:11.184Z"
},
"hierarchy": {
 "pkid": "5c7db7b5757905001387e2d6",
  "node_type": "Provider",
  "href": "/api/data/HierarchyNode/5c7db7b5757905001387e2d6/",
 "name": "CS-P",
 "hierarchy_path": "sys.hcs.CS-P"
},
"theme": {
 "pkid": "5c7db13d757905001387c33b".
 "href": "/api/data/Theme/5c7db13d757905001387c33b/",
  "name": "default"
},
"role": {
. . .
```

Password Change

An API endpoint is available to request the details needed for a user password change and to submit a password change.

To get details of the POST request and the JSON schema of the payload to change the password, use the request:

```
GET https://hostname/account/password/change?hierarchy=[hierarchy]&format=json
```

To change a user password, the request will then be of the format:

```
POST https://hostname/account/password/change?hierarchy=[hierarchy]&format=json
```

The payload is in JSON format and contains user details, old password and new password.

A successful password change request returns a response of the format:

```
{"meta": {
     "uri": "/account/password/change/"
     },
     "success": true
}
```

The request format if a user changes their own password on the GUI, payload parameters include the token, for example:

```
csrfmiddlewaretoken=am9l0mJsb2dncw==
```

In this instance, the user_pkid a part of the payload, as it is hidden in the GUI.

For a successful password change from the GUI, the user's browser client is redirected to the endpoint:

```
https://hostname/account/password/change/done/
```

This presents the user with a message and request to log in with the new password.

1.3. Anatomy of an API Response

1.3.1. API Response Overview

Below are the typical elements of an API response:

- · header API header.
- meta Meta data.
- · data Actual data contained in the model as name:value pairs.
- schema Schema describing the structure of the data of the resource, in particular the data types of the names in the name:value pairs in the data.
- resources An object grouping a list of single resource's meta and data objects in an API list response

pagination - an object containing pagination data in an API list response

Not all the elements above exist in each response. These differ depending on request parameters and whether response contains a list of resource or a single resource.

1.3.2. API Response Header

The following is a header data example of an API response from an API request not using Basic Auth:

```
Date: Tue, 28 Jun 2022 12:17:22 GMT-1s
Content-Type:
                     text/html; charset=utf-8
Content-Length:
                     0 byte
Connection: keep-alive
Content-Language:
                     en-us
Vary:
            Accept-Language, Cookie
X-Request-Id:
                     b41b12575a97b6b16ca79451b1d5c94c7f488c0b
X-Request-Duration: 0.021724
Location: /login/
                     hy1y3y2nj1bm3kjnypfz1w24egvd4vbi
X-Session-Id:
X-Session: {"max_age": 1800, "extendable": true, "expiry": "2022-06-28T12:47:22.
\rightarrow 346294+00:00"}
Set-Cookie: csrftoken=MnPzYbeItKcSyyysmHWyyypz3igZ79iy;
SameSite=Lax;
httponly;
Path=/
Set-Cookie: sessionid=q150dg1ctpgc1sza3ktggyguo4nsbg5u;
SameSite=Lax;
httponly;
Path=/
Referrer-Policy: strict-origin-when-cross-origin
Cache-Control:
Content-Security-Policy:
                            style-src 'unsafe-inline' 'self'; script-src 'unsafe-eval'

    'self';

Strict-Transport-Security: max-age=63072000
X-Content-Type-Options:
                             nosniff
X-Frame-Options:
                     SAMEORIGIN
X-XSS-Protection:
                     1; mode=block
```

- The Set-Cookie header entries with csrftoken and sessionid have SameSite=Lax; set to defend against Cross Site Request Forgery (CSRF) attacks.
- The X-Session header entry has the following properties:
 - max_age: The number of seconds remaining for the session.
 - expiry: The date at which the session will expire.
 - extendable: Boolean indicating if the client can extend the length of the session by triggering an API request.

This information is also available from a POST call to the following endpoint:

```
POST <hostname>/api/session/keep_alive/
```

An example response JSON payload:

```
{
    max_age: 86296
    extendable: false
    expiry: "2015-03-18T10:24:53.059Z"
}
```

Refer to the section: Time to Live (TTL)

Note: This header is not present in responses from Basic Auth API requests.

1.3.3. Single Resource Response

A single resource response outline is as follows:

The *schema* object is only returned for a single resource request when the *schema* request parameter is added to the request. Please see Response Elements

1.3.4. Resource List Response

The response object outline is as follows:

(continues on next page)

(continued from previous page)

1.3.5. POST/PUT/DELETE/PATCH Response

Support for synchronous and asynchronous request resulting in transactions, is controlled by the nowait parameter in the request URL. The support for asynchronous request handling is indicated in the API schema structure **actions** with the support_async property.

The outline of the default synchronous transaction response of mutator transactions when the API parameter nowait is set to be false, is as follows:

```
{
  "pkid": "51f7e09bd0278d4b28e981da",
  "model_type": "data/CallManager",
  "meta": {
    "parent_id": {
      "pkid": "51f7d06ad0278d4b34e98134",
      "uri": "/api/data/HierarchyNode/51f7d06ad0278d4b34e98134"
    },
    "summary_attrs": [
      {
        "name": "description",
        "title": "Description"
      },
      {
        "name": "host",
        "title": "Host Name"
      },
      {
        "name": "port",
        "title": "Port"
      }
    "uri": "/api/data/CallManager/51f7e09bd0278d4b28e981da"
  },
  "success": true
}
```

The outline of the synchronous response to asynchronous mutator transactions when the API parameter nowait is set to be true, is as follows:

```
{
    "href": "/api/tool/Transaction/cfe8a8fd-98e6-4290-b0c3-2dfa2224b808",
    "success": true,
    "transaction_id": "cfe8a8fd-98e6-4290-b0c3-2dfa2224b808"
}
```

To retrieve (for example by polling) the transaction status of any mutator transactions, use the *transaction_id* in the synchronous response to the asynchronous mutator transaction as follows:

```
GET /api/tool/Transaction/cfe8a8fd-98e6-4290-b0c3-2dfa2224b808
```

The response contains the status ad replay action URL, for example:

```
{
 "meta": {
        "model_type": "tool/Transaction",
        "summary_attrs":
         "name": "name",
         "title": "Name"
        "references": {}
        "actions":
          {
           "replay": {
             "class": "execute",
             "href": "/api/tool/Transaction/cfe8a8fd-98e6-4290-b0c3-2dfa2224b808/
               replay?format=ison",
             "method": "GET",
             "title": "Replay"
        }
 "data": {
       "status": "Completed",
       "username": "sysadmin",
       "resource": {
        "hierarchy: "sys",
        "after_transaction": "/api/data/GeneralHelp/5268c7d3a616540a766b91f5/?
          cached=5268f2eba616540a736b926c Entity",
        "current_state": "/api/data/GeneralHelp/5268c7d3a616540a766b91f5/ Entity",
        "before_transaction": "/api/data/GeneralHelp/5268c7d3a616540a766b91f5/
          ?cached=5268c7d3a616540a766b91f7 Entity",
        "pkid": "5268c7d3a616540a766b91f5",
        "model_type": "data/GeneralHelp",
       }
  [...]
```

This mechanism can be used to retrieve the transaction status of any transaction or its sub-transaction, using the pkid of the (sub) transaction.

For the View model, the GET call to tool/Transaction/[trans pkid] shows the View resource has no instance pkid, because a view model stores no instances.

1.3.6. Asynchronous Mutator Transaction Status Callback

When using the API parameter nowait=true, the service requester can submit optional request metadata - containing a callback URL - with any mutator request by appending the request_meta tag to the normal payload of the request.

To receive asynchronous transaction status notifications, the requesting system needs to publish an HTTP service to service requests made by the callback URL. An example of a simple http service is provided in a separate section.

The callback operation supports an optional username and password that VOSS Automate uses to perform HTTP basic authentication on requests made to the callback service. The optional elements external_id and external_reference are explained in the section on correlation identifiers.

Note the following details:

- The schema of system resources or system tools do not include reference to the request meta data in the schema definition of each resource in the system.
- The <Actual request data goes here> request data needed to for example add a country_name instance for data/Countries would be similar to: "country_name": "South Africa".
- The request data for deleting two countries for example would be

```
"hrefs":[
    "/api/data/Countries/534fdf190dd19012066433ce",
    "/api/data/Countries/534fda1d0dd1901206643397"
]
```

• For the callback service to function, the callback service needs to be accessible from the fulfillment server.

Upon completion of the asynchronous mutator transaction posted with a callback URL, VOSS Automate POSTs an HTTP request (asynchronous transaction status callback) to the callback service specified by the callback URL. The callback service needs to respond with a HTTP 200 ACK *before* internal processing of the callback. The callback includes the transaction ID sent to the requesting system as part of the synchronous response. To correlate the asynchronous transaction status callbacks with the original request, the requesting system would need to record the transaction_id returned in the synchronous response.

The HTTP headers and the payload of the asynchronous transaction status callback includes the following information:

HTTP headers:

```
{
    'accept-encoding': 'identity',
    'authorization': 'BasicdXN1cm5hbWU6cGFzc3dvcmQ=',
    'content-length': '275',
    'content-type': 'application/json',
    'host': 'localhost: 8080'
}
```

Payload:

Note the following details:

- · Correlation identifiers (see correlation identifiers) are included in the payload if they are present.
- The status of the transaction is as in the transaction log: Fail or Success.

The transaction status in VOSS Automate is not affected by the response of the HTTP service published by the requesting system. The transaction log information includes the callback request and the response returned by the callback service published by the external system.

For transactions with multiple sub-transactions, a single transaction status callback request is made upon the completion of the parent transaction. Transaction status callbacks are not supported for the parent transactions tool/BulkLoad and tool/DataImport.

In the event that the transaction status callback is not received by the external system due to for example a network outage, the external system can poll to retrieve the transaction status. For example:

```
GET /api/tool/Transaction/e6ac7c1e-c63a-11e3-9af5-08002791605b
```

Callbacks for failing transactions include error data as part of the callback body/payload. For example:

```
{u'authorization': 'Basic dXNlcm5hbWU6cGFzc3dvcmQ=',
    u'error': {u'code': 4001,
        u'http_code': 4000,
        u'message': u'Error, Duplicate Resource Found.
        data/CallbackDataModel already exists with the following
        unique data - (name = "CallbackDataModel Name 2")'},
    u'external_id': u'3x4mpl3-3xt3rn41-7d',
    u'external_reference': u'External Ref',
    u'resource': {u'hierarchy': u'542a7347c952703e3646a4c5',
        u'model_type': u'data/CallbackDataModel',
        u'pkid': u'542a7357c952703e3646a4da'},
```

(continues on next page)

(continued from previous page)

Error data, as shown in the example, includes:

- the exception code: 4001
- http error code: 400
- · error message:

```
'Error, Duplicate Resource Found. data/CallbackDataModel already exists with the following unique data - (name = "CallbackDataModel Name 2")'
```

This is the same error message structure as returned by the API for failing requests.

1.3.7. Example of an Asynchronous Mutator Transaction with nowait=true

Request:

Synchronous response:

```
{
    href: "/api/tool/Transaction/e6ac7c1e-c63a-11e3-9af5-08002791605b"
    success: true
    transaction_id: "e6ac7c1e-c63a-11e3-9af5-08002791605b"
    }
    HTTP 202 ACCEPTED
```

Asynchronous transaction status callback (console output of the simple http service provided in the separate example section):

```
POST - 2014-04-17 16:16:43.737509

Headers:
```

(continues on next page)

```
{'accept-encoding': 'identity',
 'authorization': 'Basic dXNlcm5hbWU6cGFzc3dvcmQ=',
 'content-length': '275',
 'content-type': 'application/json',
 'host': 'localhost:8080'}
Raw Callback Body:
'{"status": "Fail", "transaction":
{"href":
   "http://django.testserver/api/tool/Transaction/
    34866060-fd47-11e3-88dd-080027880ca6/",
 "id": "34866060-fd47-11e3-88dd-080027880ca6"},
 "resource": {"hierarchy": "1c0efge2c0deab10da595101",
              "model_type": "data/Countries",
              "pkid": "53ac3d41c9527062809c0021"},
              "external_reference": "External Ref",
              "external_id": "3x4mpl3-3xt3rn4l-7d"}'
Pretty Callback Body:
{u'external_id': u'3x4mpl3-3xt3rn4l-7d',
u'external_reference': u'External Ref',
u'resource': {u'hierarchy': u'1c0efge2c0deab10da595101',
               u'model_type': u'data/Countries',
               u'pkid': u'53ac3d41c9527062809c0021'},
u'status': u'Fail',
u'transaction': {u'href':
  u'http://django.testserver/api/tool/Transaction/
    34866060-fd47-11e3-88dd-080027880ca6/',
                  u'id': u'34866060-fd47-11e3-88dd-080027880ca6'}}
localhost - - [17/Apr/2014 16:16:43] "POST / HTTP/1.1" 200 -
```

1.3.8. Correlation Identifiers

In order to allow an external system use its own identifiers to cross-reference transactions in the system, the API supports two external identifiers for all transactions. This allows the external system to:

- 1. Tie together multiple transactions in the system (using for example an order number)
- 2. Track individual requests in the system using the external IDs.

External identifiers are not supported for the parent transactions tool/BulkLoad and tool/DataImport.

The transaction log will include these two IDs and the transaction log, as shown below.

You can obtain the details of the parent transaction with a given ID by using the following API call:

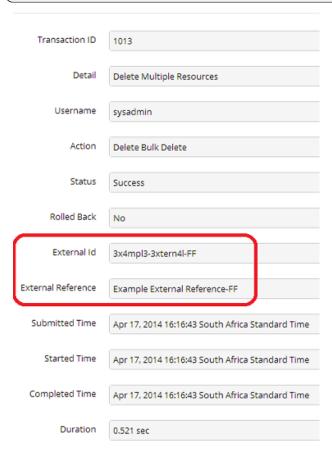

```
GET http://my.fulfillmentserver/api/tool/Transaction/
?hierarchy=[hierarchy]&

(continues on next page)
```

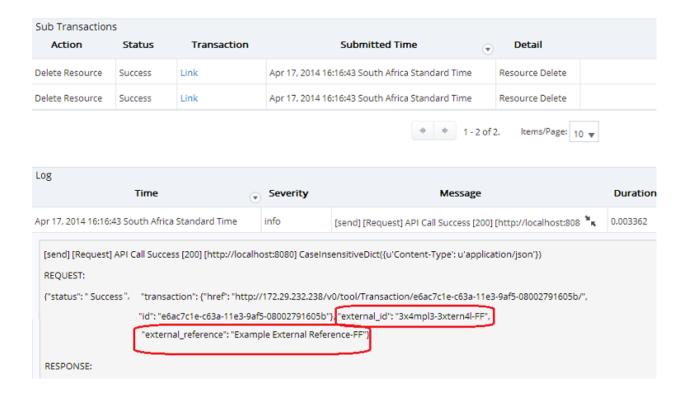

```
filter_condition=contains&
format=json&
filter_text=3x4mpl3-3xtern4l-FF&
filter_field=external.id
```

You can obtain the details of transactions tied together using an external reference number using the following API call:

```
GET http://my.fulfillmentserver/api/tool/Transaction/
?hierarchy=[hierarchy]&
   filter_condition=contains&
   format=json&
   filter_text=Example%20External%20Reference-FF&
   filter_field=external.reference
```

.

1.3.9. Example Of A Simple HTTP Server

The following code is an example of a simple HTTP server that can be used to test basic async transaction status callback operations. The code is not intended for actual use.

Note that the HTTP 200 ACK is sent asyncronously before internal processing of the callback.

```
#!/usr/bin/env python
from datetime import datetime
import SimpleHTTPServer
import SocketServer
import logging
import cgi
import json
from pprint import pprint
PORT = 8080
class ServerHandler(SimpleHTTPServer.SimpleHTTPRequestHandler):
   def do_GET(self):
        SimpleHTTPServer.SimpleHTTPRequestHandler.do_GET(self)
    def do_POST(self):
        self.send_response(200)
        self.wfile.write("ACK")
        # Insert internal processing here.
        # Below is an example of internal processing that simply prints out the
```

```
# callback request.
    print "\nPOST - {}".format(datetime.now())
    print "Headers:"
    print(dict(self.headers))
    print "\nRaw Body:"
    body = self.rfile.read(int(self.headers['Content-Length'])).decode('utf-8')
    pprint(body)
    print "\nPretty Body:"
    pprint(json.loads(body))

Handler = ServerHandler

httpd = SocketServer.TCPServer(("", PORT), Handler)

print "Serving at port", PORT
httpd.serve_forever()
```

2. Using the API

2.1. Developer Guidelines

The following practices are recommended to all developers. The aim is to reduce the number and extent of any updates that may be necessary.

- 1. The order of elements within the interface data and messages may change, within the constraints of the interface specification. Developers should avoid unnecessary dependence on the order of elements to interpret information exchanged with VOSS Automate.
- New interface methods, operations, actions, requests, responses, headers, parameters, attributes, other elements, or new values of existing elements, may be introduced into the VOSS Automate interfaces. Developers should disregard or provide generic treatments where necessary for any unknown elements or unknown values of known elements encountered.
- Notifications, operations, methods, actions, requests, responses, headers, parameters, attributes, and other elements from previous versions of VOSS Automate interfaces, will remain, and will maintain their previous meaning and behavior to the extent possible and consistent with the need to correct defects.
- Applications should not be dependent on interface behavior resulting from defects (behavior not
 consistent with published interface specifications), since the behavior can change when defects are
 fixed.
- 5. The use of deprecated methods, operations, actions, handlers, requests, responses, headers, parameters, attributes, or other elements should be removed from applications as soon as possible to avoid issues when those deprecated items are removed from VOSS Automate or its interfaces.
- 6. Application Developers should be aware that not all new features and new supported devices (for example, phones) will be forward compatible. New features and devices may require application modifications to be compatible or to make use of the new features or devices.

2.2. Workflow Tasks

- 1. Log in with "hcsadmin@sys.hcs", using the password that was set during the installation.
- 2. Get the Provider Name & Provider PKID using the data/HierarchyNode API in the url, where "hierarchy" = "sys.hcs".
- 3. For all POST/PUT/DELETE operations to be asynchronous transactions, set the query param "nowait=true" in the URI.
 - To create a provider admin, use the relation/User API in the url, with the hierarchy value that you receive in the GET call of Step-1 (PKID or the dot notation).

- 4. Creating a Reseller is not mandatory, and it depends on the structure of provisioning. A Reseller must be created if the tree structure of the provisioning is: Provider -> Reseller -> Customer -> Site.
 - To create a Reseller use the relation/HcsResellerREL API, with the Provider hierarchy of the API of Step-1.
- 5. To create a Reseller Admin, use the relation/User API in the url, with the hierarchy value of the Reseller (PKID or the dot notation).
- 6. To create a Shared Network Device (Cisco Unified Communications Manager or Unity), it needs to be done either at either the Provider Hierarchy or the Reseller Hierarchy Level.

Use the following APIs for each of the devices listed below:

| Device | API |
|--------------------------------------|--------------------------------|
| Cisco Unified Communications Manager | relation/HcsCallManagerREL |
| Unity | relation/HcsUnityConnectionREL |
| Presence | relation/HcsPresenceREL |
| WebEx | relation/HcsWebExREL |

- 7. The Customer is directly under Provider if the deployment structure is Provider -> Customer -> Site or under the Reseller if the deployment structure is Provider ->Reseller -> Customer -> Site.
 - To create a Customer, use the relation/HcsCustomerREL API, with the hierarchy of provider/reseller that can be retrieved using the respective API.
- 8. To create a Customer Admin, use the relation/User API in the url, with the hierarchy value of the Customer(PKID or the dot notation).
- 9. If the Customer is using "shared uc apps", you cannot add dedicated devices for that customer.

Adding a Dedicated Network Device for a Customer(Cisco Unified Communications Manager or Unity) needs to be done at the Customer hierarchy Level. Use the following APIs for each of the devices listed below:

| Device | API |
|--------------------------------------|--------------------------------|
| Cisco Unified Communications Manager | relation/HcsCallManagerREL |
| Unity | relation/HcsUnityConnectionREL |
| Presence | relation/HcsPresenceREL |
| WebEx | relation/HcsWebExREL |

- 10. Once the devices are configured, a Network Device List (NDL) needs to be configured for the Customer. To create an NDL use the relation/HcsNetworkDeviceListREL API. At least one device is required to add an NDL.
- 11. It is not mandatory to have a Network Device List (NDL) to create a Site. However, an NDL is needed to add a Subscriber or Phone or Lines to a Site. Sites created without an NDL can later be able associated to one.
 - To create a site, use the relation/HcsSiteREL API.
- 12. Using the relation/User API will only be local Cisco Unified Communications Domain Manager admin. To add an Admin who is also a Subscriber, use the relation/User API, which can later be moved to any Cisco Unified Communications Manager that is associated with the Site.

To create a Site Admin, use the relation/User API in the url, with the hierarchy value of the Site (PKID or the dot notation).

- 13. Complete the following activities at the Site level:
 - a. To create a Subscriber use the relation/Subscriber API.
 - b. To create a Line use the view/HcsDNMgmtVIEW API.
 - c. To create a Phone use the relation/SubscriberPhone API.
 - d. To create a Voicemail use the relation/Voicemail API.

2.3. Developer Tools

The Developer tools that are available in Mozilla Firefox and Google Chrome allow all the actions exposed by each API to be displayed as they are being called in the GUI. This gives us the opportunity to view the request and response actions as they occur, and provide the details of what each API provides and its relationship to the GUI.

With Developer tools enabled, the network tab of the Developer tools show the information that is contained in each request and response as you navigate and use the GUI. This allows service providers a direct view as to what data each API requires.

3. Handling API Fault Responses

3.1. Fault Responses

To interpret the HTTP fault responses codes and the response_code within the data element of a API response for a faulty request, refer to the list of possible error codes.

3.2. Error Messages

The tables below provide:

- · an error code range reference
- · message details of the error codes

To inspect application log messages from the command line, set the debug level on and view the app log. Refer to the Platform Guide for more details.

```
voss set_debug 1
log view voss-deviceapi/app.log
```

The message strings are shown in their template format: references to specific properties are shown as placeholders that are represented by {} .

Note: For AuthError codes, the following rules apply:

- For API version 11.5.3 and below, only the **AuthError_11_5_3** table messages apply.
- For API greater than 11.5.3, **AuthError** table messages override the corresponding **AuthError_11_5_3** table messages, while the unchanged **AuthError 11 5 3** table messages still apply.

| RuleError | Message | HTTP Code |
|-----------|--|--------------|
| 15000 | Invalid hierarchy for this operation. Please select new hierarchy. | 449 |
| 15001 | Multiple devices found at this Hierarchy level. Please select device. | 449 |
| 15002 | Multiple network device lists (NDL) found at this Hierarchy. Please select a NDL. | 449 |
| 15003 | Network device list reference (NDLR) not found at this Hierarchy. | 449 |
| 15004 | Network device list (NDL) with pkid [{}] not found in available list. Please check NDL rule at the Hierarchy | 400 |
| 15005 | No network device lists (NDL) found at this Hierarchy. | 449 |
| 15999 | Error, (UNHANDLED_ERROR) | 400 |

| TransactionError | Message | HTTP Code |
|------------------|--|--------------|
| 23000 | Unable to determine Transaction ID. | 400 |
| 23001 | Transaction must be registered with valid user details. | 400 |
| 23002 | Transaction not found. | 404 |
| 23003 | Transaction must be viewed with valid user details. | 400 |
| 23004 | {} (MAX_INSTANCES_EXCEEDED) | 400 |
| 23005 | Invalid Transaction State: {} | 400 |
| 23006 | Transaction canceled. | 400 |
| 23007 | Transaction must be registered with the hierarchy in which it is executing. | 400 |
| 23008 | Transaction must be registered with model_type if pkid is provided. | 400 |
| 23010 | The current filter caused a long running request. Please add more filter fields, use Case Sensitive or change the criteria types to one of {}. | 400 |
| 23011 | Invalid choices field [{}]. | 400 |
| 23012 | The [{0}] condition on field [{1}], is not allowed. | 400 |
| 23013 | Invalid start and end date range provided in filter. | 400 |
| 23014 | Invalid start and end ID range provided in filter. | 400 |
| 23015 | Invalid ID value in filter | 400 |
| 23999 | Error, {} (UNHANDLED_ERROR) | 400 |

4. Tool APIs

4.1. Introduction to Tool APIs

This section describes API calls that are not related to a specific model. The full URL would include the host name: http://[hostname].

The calls described here all contain /tool/ in the URL and the full list can be obtained by the GET call for choices:

| Task | Call | URL | Parameters | Response |
|------------|------|--------------------|--------------------------------------|--|
| List tools | GET | /api/tool/choices/ | format=json hierarchy=[hierarchy] | JSON format of the list of tools as title - value pairs. |

Variables are enclosed in square brackets, e.g.:

- · [hierarchy] is the hierarchy UUID
- [filename] refers to a file

Other parameters are described with the relevant API call.

4.2. Search and Search Result Export

For an API call that carries out a search, a POST payload in JSON format is added.

| Task | Call | URL | Parameters | Payload |
|--------|------|-------------------|--------------------------------------|---------------------|
| Search | POST | /api/tool/Search/ | format=json hierarchy=[hierarchy] | {"query":"[query]"} |

The value of [query] follows Search syntax, for example:

```
{"query":"data/Countries with country_name contains King"}
```

While the default search direction is down, a second parameter can be added to [query] to indicate the hierarchy direction to search. These are enabled by adding a value true:

• hierarchy_paths - up the hierarchy

- hierarchy_shallow at the local hierarchy
- hierarchy_all up and down the hierarchy

For example, if the user making the API call is at sys.hcs, then a call payload like:

```
{"query":"relation/Bundle with name is 'HcsBase' ", "hierarchy_paths":true}
```

will also search up the hierarchy path.

The parameter filter_hierarchy can also be used to filter the hierarchy of search results. Specifying a hierarchy to which the user has no access will return a Permission Denied error.

Note:

- If for both hierarchy=sys.hcs and filter_hierarchy=sys.hcs.CSP for example are used, then filter_hierarchy=sys.hcs.CSP takes precedence.
- If for neither hierarchy=sys.hcs nor filter_hierarchy=sys.hcs.CSP for example are used, then the user's hierarchy is applied.

The Request payload can also be a GET parameter, for example:

| Task | Call | URL | Parameters | Response |
|--------|------|-------------------|---|-----------------------------------|
| Search | GET | /api/tool/Search/ | format=json hierarchy=[hierarchy] filter_hierarchy=[hierarchy] query=[url_query] | JSON format of the search result. |

The value of [url_query] is URL encoded string, for example:

data/Countries%20with%20country_name%20contains%20King

Furthermore, the meta property of the schema in the response to /api/tool/Search/ contains action details for the export of search results. This includes the URL for the data export POST request:

/api/export/export_data/?url=/api/tool/Search/

as well as the URL:

/api/view/ExportData/add

which has a schema that lists the data export data type choices that will be used as a parameter to the POST call.

4.3. Bulk Load API

Two API calls are required.

| Task | Call | URL | Parameters | Response |
|-------------|------|---|---|--|
| Submit file | POST | /api/ uploadfiles/ This URL will be moved to tool/UploadFile in future. | hierarchy=[hierarchy] Content-Type: multipart/form-data name='uploadedfile' filename= <filename> the file to upload</filename> | {"uploadedfiles": [{"id": " <file_id>", "name": "<filename>"}]}</filename></file_id> |

The response is HTTP 202

| Task | Call | URL | Parameters | Payload |
|------|------|-------------------------|--|---|
| Bulk | POST | | | Examples: |
| Load | | /api/tool/ BulkLoad/ | <pre>method= bulkload_spreadsheet hierarchy=[hierarchy]</pre> | <pre>{'bulkload_file': '<filename>', 'execute_immediately': true} or: {'bulkload_file': '<filename>', 'execute_immediately': false 'execute_date': '2013-06-20', 'execute_time': '12:00:00', 'execute_timezone': '0'}</filename></filename></pre> |

The following curl commands illustrate the two steps:

Step 1

```
curl -H 'Authorization: Basic <auth_key>'
   -F uploadedfile="@<file>.xlsx"
   'http://<hostname>/api/uploadfiles/'
```

Step 2

```
curl -H 'Authorization: Basic <auth_key>'
    -H 'Content-Type: application/json'
    -H 'accept: application/json'
    --data-binary '{"bulkload_file":"DEMO.xlsx","execute_immediately":true}'
    'http://<host>/api/tool/BulkLoad/?hierarchy=[hierarchy]&
    method=bulkload_spreadsheet&
    nowait=true&
    format=json'
```

The response to this call is for example as in the following table.

```
Response

{"href": "/api/tool/Transaction/0b340a6f-b658-48bb-ac8c-7562adc5572d",
    "success": true,
    "transaction_id": "0b340a6f-b658-48bb-ac8c-7562adc5572d"}
```

- If the Bulk Load is to be scheduled, the payload of the second task includes schedule details:
 - execute_immediately is set to false
 - execute date is added in the format YYYY-MM-DD
 - execute_time is added in the format HH:MM:SS
 - execute_timezone is added in the format of a numeric value in minutes relative to UTC. For example, UTC is 0, UTC+2:00 is 120, UTC-1:00 is -60, and so on.
- An entry is also generated in the schedule; that is, an instance is added to the data/Schedule module.
- If the second task payload has 'execute_immediately':true, a POST is generated to /api/data/Bulkload/. The payload includes the uploaded filename and a generated name and time stamp as well as a description, for example:

```
{'filename': '<file>.xlsx', 'description': 'Generated by Bulk Loader
Administration Tools', 'name': 'AnyUser.xlsx -- 2013-05-21
16:47:11.801664 (UTC)'}
```

To inspect the detailed progress and status of the transaction, use the API call from the response above:

GET /api/tool/Transaction/[pkid]

with parameters:

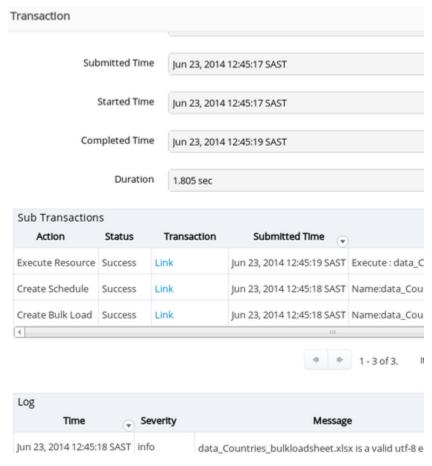

- hierarchy=[hierarchy]
- format=json

The response to this GET call is a JSON object that provides details of the transaction, as for example in the truncated snippet:

```
"href": "/api/tool/Transaction/[pkid]
"log_id": "53a8053ea616540708141f44",
"message": "data_Countries_bulkloadsheet.xlsx is a valid
```

```
"severity": "info",
    "time": "2014-06-23T10:45:18.029000",
    "transaction_id": "[pkid]"
  }
],
"pkid": "[pkid]",
"resource": {},
"rolled_back": "No",
"started_time": "2014-06-23T10:45:17.813000",
"status": "Success",
"sub_transactions": [
    "action": "Execute Resource",
    "detail": "Execute : data_Countries_bulkloadsheet.xlsx -- ...
    "status": "Success",
    "submitted_time": "2014-06-23T10:45:19.567000",
    "transaction": "/api/tool/Transaction/[pkid1]
  },
    "action": "Create Schedule",
    "detail": "Name:data_Countries_bulkloadsheet.xlsx -- 2014- ...
    "status": "Success".
    "submitted_time": "2014-06-23T10:45:18.912000",
    "transaction": "/api/tool/Transaction/[pkid2]
  },
    "action": "Create Bulk Load",
    "detail": "Name:data_Countries_bulkloadsheet.xlsx -- 2014-06 ...
    "status": "Success",
    "submitted_time": "2014-06-23T10:45:18.419000",
    "transaction": "/api/tool/Transaction/[pkid3]
  }
],
"submitted_time": "2014-06-23T10:45:17.794000",
```

On the GUI, the same transaction displays as in the Transaction log image.

For long transactions, to retrieve a summary of the status of the transaction, the transaction can be polled, using poll in the URL, using the same parameters:

GET /api/tool/Transaction/poll/?transactions=[pkid]

In this case, there is a shortened response, for example:

```
{"[pkid]":
    {"status": "Processing",
        "href": "/api/tool/Transaction/0b340a6f-b658-48bb-ac8c-7562adc5572d",
        "description": null}
}
```

4.4. Move and Bulk Move

The following model types can be enabled for this operation:

- · Data models
- · Device models
- · Relations

For an API call that carries out a move on a <model_type>, a POST payload in JSON format is added.

A move can only take place from a source hierarchy equal to or lower than [target_hierarchy].

Task

Move the instance with [pkid] to [target_hierarchy]

| Call | URL | Parameters | Payload |
|------|--|--|--|
| POST | /api/tool/DataMove/ ?model_type= <model_type></model_type> | format=json hierarchy=[hierarchy] context_hierarchy= [tar- get_hierarchy] (nowait=true) | {"hrefs": ["/api/ <model_type>/[pkid]"]}</model_type> |

Task

Move one or more model instances ([pkid1], [pkid2],...) from source hierarchy (pkid or dot notation) to target_hierarchy (pkid or dot notation).

| Call | URL | Parameters | Payload |
|------|--|--|--|
| POST | /api/tool/DataMove/ ?model_type= <model_type></model_type> | format=json hierarchy=[hierarchy] context_hierarchy= [tar- get_hierarchy] (nowait=true) | {"hrefs": ["/api/relation/Subscriber/[pkid1]", "/api/relation/Subscriber/[pkid2]",]} |

For a list of hierarchy pkids and their dot notation available from [hierarchy], use the GET call:

```
GET api/relation/<model_type>/
  ?hierarchy=[hierarchy]
  &format=json
  &schema_rules=true
```

4.5. Data Extract

Two endpoints are available:

operations

Get the available DataExtract operations endpoints.

```
GET api/tool/DataExtract/operations/
?hierarchy=[hierarchy]
&format=json
```

Returned payload:

```
{"value":"execute",
    "title":"Execute"},
    {"value":"help",
        "title":"Help"},
    {"value":"nbi_subscriber",
        "title":"Nbi Subscriber"},
    {"value":"read",
        "title":"Read"}]
}
```

nbisubscriber

For example, on a system with NBI deployed, get the subscriber data for subscriber instance with <PKID>:

```
GET api/tool/DataExtract/nbisubscriber/<PKID>/
?hierarchy=[hierarchy]
&format=json
```

Returned payload:

```
"FirstName": "NBI",
"LastName": "User EKB-9492",
"ActivationDate": "2021-06-17T00:00:00",
"Location": "CL1-AB-C-Berlin",
"Email": "NBIUser@nbivoss.onmicrosoft.com",
"Username": "NBIUser",
"ExternalID": "EKB-8003-AB-C-BE",
"Customer": "AB_Group",
"Lines": [
{
 "DDI": "+494215381218",
 "ExtensionNumber": "8211218"
},
 "DDI": "+494215381227".
 "ExtensionNumber": "8211227"
}
],
"Devices": [
 "Model": "Microsoft Teams",
 "Name": "MSTNBIUser@nbivoss.onmicrosoft.com"
}
],
"FMC": {}.
"EndUserVoicemail": false,
"HardwareGroup": "[\"AB_Group-Germany-CL1-NDL\", \"hcs.CS-P.CS-AB.AB_Group\"]",
"MobilityProfiles": [
{
```

```
"Model": "Cisco 6921",
  "Name": "NBIUser-UDP"
}
 ]
}
```

Custom Workflows 4.6.

Custom Workflows can be added to:

- · Domain Models
- Relations

A Custom Workflow can be called from a model instance.

The usage in the URLs and parameters below are:

[model]

- Domain Model [domain/DomainModelName]
- Relation [relation/RelationName]

[pkid]

Model instance pkid

[CustomWF]

Custom Workflow name. The name is of the format add-, del- to indicate the operation type.

- · For Domain Models, the Custom Workflow name suffix corresponds with a Group name of Domain Model attributes.
- For Relations, the Custom Workflow name suffix corresponds with the alias of the joined model type.

To get the payload schema for a Custom Workflow, carry out a list API call for the instance, with parameters:

| Task | | Call | URL | Parameters |
|---------------|--------------|------|----------------------|---|
| Get schema | payload a | GET | /api/[model]/[pkid]/ | hierar- chy=[hierarchy] format=json schema=true schema_rules=true |

The response contains:

• The action to carry out the Custom Workflow. For example, for an add action on a domain model DOMAIN100 instance with a group name or alias called ADDRESS:

```
AddADDRESS: {
href: "/api/domain/DOMAIN100/523c2213a61654174273ab07/+AddADDRESS/"
title: "Addaddress"
                                                                         (continues on next page)
```

```
schema: "ADDRESS"
method: "POST"
submit: "payload"
class: "add"
}
```

 The schema of the model in the response contains the specification of the submit payload for the Custom Workflow.

| Task | Call | URL | Parameters | Pay- load |
|--------------------------|------|---|---------------------------|--------------|
| Call Custom add workflow | POST | /api/domain/[model]/[pkid]/+[CustomWF]/ | hierar- chy=[hierarchy | See below |

Payload for grouped attributes is defined in the schema that is returned from the GET call above. For PUT methods the resource data is replaced with the data specified in the request. All fields of the resource is replaced with the fields in the request.

This means that:

- · fields not present in the request that are present in the resource will be dropped from the resource
- fields present in the request that are not present in the resource will be appended to the resource
- the data of fields present in the request is used to update fields that already exist in the resource

PATCH methods operate in two modes depending on the content type:

- Content type: application/json
- The values of data fields present in the request is used to update the corresponding resource fields. This means that:
 - Fields present in the request but not in the resource is appended to the resource. The value of each field that is already present in the resource is updated from the request data.

Note: Field values that are set to null in the request is dropped from the resource. Fields that are present in the resource but not in the request are left untouched.

Content type: application/json-patch+json

Existing resource data is patched according to RFC6902.

Modifying data fields:

- To drop the field from a data model, specify null as the parameter value (i.e. {"field": null})
- To blank out a string value set the parameter value to an empty string (i.e. {"field":""})
- When the key (field name) appears in the field for a parameter, then the field is updated with the supplied value.
- · Any field that is not specified in the request will be left untouched
- When a key (field name) is specified but no value is supplied, or an empty string is supplied, the value is blanked out or set to NULL

5. Transactions

5.1. List Transactions

To list transactions on the system use the following operation

```
GET https://<server_address>/api/tool/Transaction/
?hierarchy=[hierarchy]
&format=json
&summary=true
```

The following query parameter illustrates how a second page of 50 transactions in the transaction log is requested.

```
skip=50
&limit=50
&hierarchy=[hierarchy]
&format=json
&summary=true
&direction=desc
&order_by=submitted_time
```

For further information on the query parameters refer to API Parameters above.

The synchronous response contains:

- pagination information
- · meta data specifying the summary attributes of the transaction log view
- · resources containing a list of the transactions in the transaction log

5.2. Get Instance Transactions

The status of a specific transaction can be retrieved by using a GET call to /tool/Transaction for a specific transaction pkid (also referred to as transaction ID or transaction_id). The transaction_id is available in for example the synchronous response to an asynchronous mutator transaction.

For example, if the transaction_id in the response is [pkid], then the transaction can be polled with:

```
GET https://<server_address>/api/tool/Transaction/[pkid]
```

The GET response data section of the JSON content for a transaction also shows:

- submitter_host_name: the host name of the application node that scheduled the transaction.
- processor_host_name: the host name of the application node that processed the transaction (this value will only be set once the transaction is processed).

On a clustered system, these attributes make it possible to distinguish between the application nodes on which the transaction was respectively scheduled and processed.

Refer to the examples in the API Response topics, in particular, the topics POST/PUT/DELETE/PATCH Response and Asynchronous Mutator Transaction Status Callback.

5.3. Poll Transactions

It is recommended to use asynchronous transaction call back mechanism described in "Asynchronous Mutator Transaction Status Callback". If this can however not be used a consumer of the VOSS Automate API can also use this polling mechanism to poll the status of individual transactions using the poll action of the transaction tool. A user interface that allows a user to monitor the progress of a given transaction can use the following method to retrieve the status of a given transaction:

```
GET /api/tool/Transaction/[pkid]/poll/?format=json
```

The response contains essential status of the transaction, for example:

```
{
    [pkid]: {
        status: "Success",
        href: "/api/tool/Transaction/[pkid]",
        description: "Name:RDP-auser1857 Description:RD for auser1857"
    }
}
```

5.4. Replay Transactions

Transactions that have failed can, under certain circumstances, be replayed. This means that the transaction is re-submitted with the original request parameters. This is done by specifying the pkid of the transaction

```
GET https://<server_address>/api/tool/Transaction/[pkid]/replay/
```

The transaction current operation replays the transaction and the result returns the list view of the transaction log.

5.5. Edit and Replay Transactions

Transactions can, under certain circumstances, be edited and then replayed. This means that the transaction is re-submitted with the updated request parameters. This is done by specifying the pkid of the transaction:

```
GET https://<server_address>/api/tool/Transaction/[pkid]/edit-replay/
```

The transaction current operation edit and then replays the transaction and the result returns the list view of the transaction log.

5.6. Sub Transactions

The sub-transactions of a transaction with pkid can be retrieved by submitting the following URI

```
GET https://<server_address>/api/tool/Transaction/[pkid]/sub_transaction/
```

5.7. Log Transactions

The log messages of a transaction with pkid can be retrieved by submitting the following URI

```
GET https://<server_address>/api/tool/Transaction/[pkid]/log/
```

5.8. Transaction Choices

A URL endpoint and parameter is available to list the transaction actions as they may be shown in the transaction log.

• The API call to get the list of transaction actions uses the parameter and value: field=action, for example:

```
GET api/tool/Transaction/choices/?
field=action&
hierarchy=[hierarchy]&
format=json
```

The output shows the list of transaction actions:

```
"title": "Auto Migrate Base Provider"
 },
  {
    "value": "Auto Migrate Base Site Dat",
    "title": "Auto Migrate Base Site Dat"
 },
  {
    "value": "Auto Migrate Dial Plan",
    "title": "Auto Migrate Dial Plan"
 },
    "value": "Auto Migrate Feature Subscriber Phone Cft",
    "title": "Auto Migrate Feature Subscriber Phone Cft"
 },
    "value": "Auto Migrate Hotdial Data",
    "title": "Auto Migrate Hotdial Data"
 },
    "value": "Auto Migrate Init Ippbx",
    "title": "Auto Migrate Init Ippbx"
 },
    "value": "Auto Migrate Internal Number Inventory",
    "title": "Auto Migrate Internal Number Inventory"
},
```

5.9. Transaction Filters

In addition to the filter parameters that can be applied to transactions as indicated in the topic on API Parameters, transactions in particular can be filtered:

- By the following values for the URL parameter filter_field:
 - Transaction ID: id
 - Start or end submitted time: submitted_time
 - The transaction message: message
- By also listing sub transactions using the URL parameter and value subtransactions=true. By default, sub transactions are not listed, in other words, the value is false.
- To carry out a filter on sub-transactions of a parent transaction, the /sub-transactions/ endpoint is added to the GET request:

```
/api/tool/Transaction/[parent-pkid]/sub-transactions/
```

• To carry out a filter on transaction logs of a parent transaction, the /logs/ endpoint is added to the GET request:

```
/api/tool/Transaction/[parent-pkid]/log/
```

The transaction filters do not apply to logs.

The parameters can have the filter_condition values:

- eq (equals)
- ne (not equals)
- gt (greater than)
- gte (greater than or equals)
- 1t (less than)
- 1te (less than or equals)

The date-time is a filter_text value for filter_field=submitted_time.

The format follows RFC3339: [https://tools.ietf.org/html/rfc3339] and is YYYY-MM-DDTHH:MM:SS.fZ, where:

- "T" is the time separator and the character should be added.
- "Z" indicates UTC time and the character should be added.
- "f" represents the decimal fraction of a second and the character should not be added. The specification of the decimal fraction is optional.

For example:

June 29 2016 14 hours 41 minutes 0.01 seconds UTC, is:

```
2016-06-29T14:41:00.01Z
```

To filter for transactions after this date-time, the API call is:

```
GET api/tool/Transaction/?
hierarchy=[hierarchy]
&format=json
&filter_field=submitted_time
&filter_text=2016-06-29T14:41:00.01Z
&filter_condition=gt
```

To filter between transaction IDs or times, two parameter sets are needed.

For example:

• To filter transaction IDs between 12000 and 13000:

```
GET api/tool/Transaction/?
hierarchy=[hierarchy]
&format=json
&filter_field=id
&filter_text=12000
&filter_condition=gt
&filter_field=id
&filter_text=13000
&filter_condition=lt
```

• To filter transactions between June 29 2016 14 hours 41 minutes UTC and June 29 2016 15 hours 41 minutes UTC (no fraction of a second in the example):

```
GET api/tool/Transaction/?
hierarchy=[hierarchy]
&format=json
&filter_field=submitted_time
&filter_text=2016-06-29T14:41:00Z
&filter_condition=gt
&filter_field=submitted_time
&filter_text=2016-06-29T15:41:00Z
&filter_condition=lt
```

If the upper or lower bound in the filter are not available, the transactions with values between the filter values and the bound are returned.

When the URL parameter subtransactions=true is used, the data object in the JSON API response shows:

- a parent transaction has: parent: null
- a sub transaction has: parent: <pkid>, where <pkid> is the value of the parent attribute pkid.

The example snippets below show the values of parent:

```
data: {
  username: "system",
  status: "Success",
  description: "",
  parent: null,
  pkid: "01a559c5-e77f-40e7-8403-683d7204d1e1",
  friendly_status: "Success",
  detail: "HcsLdapSyncSchedule--1",
  action: "Execute Schedule",
  href: "/api/tool/Transaction/01a559c5-e77f-40e7-8403-683d7204d1e1/",
  txn_seq_id: "17693",
  data_type_: "tool/Transaction",
  message: "".
  submitted_time: "2016-07-14T12:13:41.758000Z"
}
data: {
  username: "system",
  status: "Success",
  description: "",
  parent: "f4daa234-590d-4002-a3b0-8c329c583d1d",
  pkid: "019f44a3-df6e-4e4f-86f3-a09a6b91e482",
  friendly_status: "Success",
  detail: "10.120.2.221",
  action: "Import Ldap",
  href: "/api/tool/Transaction/019f44a3-df6e-4e4f-86f3-a09a6b91e482/",
  txn_seq_id: "17695",
  data_type_: "tool/Transaction",
  message: "models completed.",
  submitted_time: "2016-07-14T12:13:43.075000Z"
```

}

• In the case of a transaction error, the message attribute value will show the corresponding error message. If a custom message was defined in a provisioning workflow, and the response is the result of the workflow, the value will be the custom message.

To filter transaction messages, the parameter filter_field=message is used, with at least one of the following additional filter criteria:

- a date range of maximum 7 days using submitted_time
- an additional filter_field, with one of the conditions:
 - * filter_condition=contains
 - * filter_condition=startswith

Also required is the case sensitive parameter:

* ignore_case

Note that a filter is by default case insensitive. If the case is explicitly set, then it should be added to each filter parameter group in order to ensure proper parameter grouping.

The additional criteria do not apply to sub-transaction message filters, because the [parent-pkid] in the URL serves as an additional filter.

The example below is a message filter that contains "Invalid business key", by date range:

```
GET api/tool/Transaction/?
hierarchy=[hierarchy]
&format=json
&filter_field=submitted_time
&filter_text=2016-06-25T14:41:00Z
&filter_condition=gt
&ignore_case=false
&filter_field=submitted_time
&filter_text=2016-06-29T15:41:00Z
&filter_condition=lt
&ignore_case=false
&filter_field=message
&filter_field=message
&filter_text=Invalid%20business%20key
&filter_condition=contains
&ignore_case=false
```

6. API Examples

6.1. API Examples Overview and Conventions

The example sections illustrate the use of the API for a number of calls, using the curl command line tool. Each example shows the command and the console output.

- · API calls are illustrated:
 - From server http://localhost
 - Referencing a relation: relation/LineRelation.
- User authorization is for two administrator users:
 - one user has additional permissions to import and bulk load.
 - The Authorization header and hierarchy parameter in the URL identify the two users.
 - Field Display Policies and Configuration Templates in URL parameters can differ according to the MenuLayout associated with the user role, for example, &policy_name=LineMenuFDPSite is a Field Display Policy applied to relation/LineRelation from a Site administrator user menu.
- Where a response to an API call shows an instance of /api/tool/Transaction/, the transaction instance details can be inspected with a GET call to this instance. An example is shown in this section.
- Some payload files and console output is truncated (indicated with ellipses or text: "snippets").
- Line breaks have been added to console output in the examples for better formatting.
- The a selection of the MS Excel bulk load sheet LineRelation.xlsx columns are shown in a table.

6.2. POST

- task: POST and instance of relation/LineRelation
- · user: site administrator
- hierarchy: 55b9dc81a6165413b9d16ab6
- Field Display Policy: LineMenuFDPSite
- · Configuration Template: line-cft

```
$ curl -v
```

- -H 'Authorization: Basic YWRtaW5AbG9jdXMxLmNvbTpwYXNzd29yZA=='
- -H 'Content-Type:application/json'

```
--data-binary @post-payload.json
       -X POST 'http://localhost/api/relation/LineRelation/
                ?hierarchy=55b9dc81a6165413b9d16ab6
                &policy_name=LineMenuFDPSite
                &template_name=line-cft

7. Backward Compatibility

7.1. API Backward Compatibility and Import

The VOSS Automate system maintains a Data Model version data store containing all versions that have been imported onto the system.

While there is always a current version of a Data Model in use on the system, a check is carried out during the import of data:

- If the current version is newer than the definition of the imported data, then the imported definition data is flagged internally as automigration: false to prevent resources from auto-migrating from a newer version to an older version.
- Importing an older version will not replace the latest definition as the default schema. The older version will only be added to the version store.

The snippet example below shows the automigration attribute:

This model definition version store makes it possible for version definition imports to be sequence independent, allowing a freshly installed system to construct the version history for backwards compatibility.

8. General API Reference

8.1. Using the API Reference

For each resource, a study of the general Reference for Actions in conjunction with the lists of actions for a resource provides the reference for the resource.

The Field Reference for a resource provides payload details. The list below explains the Field Reference for a resource:

- The field Title is indicated in bold. An asterisk indicates the field is mandatory.
- If the field Type is an array, its the Field Name has a [n] suffix.
- Object and array names are listed to provide the context of fields.
- If a field belongs to an object or an array, the full name is in dot separated notation.
- Where cardinality is shown, the range is [MinItems..MaxItems].
- If a field has a Default value, the value is shown.
- If a field has a Pattern, the regular expression pattern is shown.

In addition, a number of conventions are followed some general guidelines should be noted.

- The full URL includes the host name: https://[hostname]; for example, https://172.29.232.62
- Variables are enclosed in square brackets.
- [hierarchy] is the hierarchy which can be specified as:
 - UUID (Universally Unique Identifier); for example, 1c012432c0deab00da595101 or
 - In dot notation; for example, ProviderName. CustomerName. LocationName

For a list of available hierarchy UUIDs and their dot notations, refer to the data in the response of the call:

GET /api/data/HierarchyNode/?format=json

- [pkid] is the ID of the resource instance. Refer to the List action reference for the resource.
- · [filename] refers to a file.
- where a custom action (with "+" in the URL) is available, the POST method is used to execute the Provisioning workflow with the name following the "+". For more information, consult the custom workflow section of the API Guide.

Relations, Domain models, and Views may have parameters where the choices are constructed from unexposed models (and that may not be available in the API Reference). You can obtain these choices by using the URL specified in the target attribute of the schema of parameter.

To illustrate, below is an extract of the schema for a model called relation/SystemUser that contains a parameter SSOUser, which links a user in the system to a user in an SSO identity provider server. This is done by mapping the SSO user name (sso_username) of the user in the SSO server (sso_idp) to a user in VOSS Automate (data/User).

The schema of relation/SystemUser shows that the choices that are available from SSO Identity provider servers are stored in the model data/SsoldentityProvider. The list of SSO identity providers could be obtained by using the URL in the target attribute of the schema.

```
GET /api/relation/SystemUser/?hierarchy=[hierarchy]
&format=json
&schema=1
```

The following is an extract of the schema of relation/SystemUser:

```
. . .
"SSOUser": {
            "items": {
                 "type": "object",
                 "properties": {
                       "sso_username": {
                           "required": true,
                            "type": "string",
                           "description": "The name identifier that is used for
                              an SSO authenticated user.",
                            "title": "SSO Username"
                      },
                       "sso_idp": {
                            "target": "/api/data/SsoIdentityProvider/choices/
                               ?hierarchy=[hierarchy]
                               &field=entity_id
                               &format=json
                               &auth_token=[auth_token]",
                            "format": "uri",
                            "required": true,
                           "choices": [],
                           "target_attr": "entity_id",
                           "target_model_type": "data/SsoIdentityProvider",
                           "title": "SSO Identity Provider",
                            "type": "string",
                            "description": "The entity id of the SSO Identity
                              Provider."
                      },
 . . .
```

8.2. API Schema

The schema for a resource is obtained in the request parameter:

?format=json&schema=1

This way of requesting the schema is only available when requesting an Add form or when viewing a resource.

A specific url is also available for obtaining the schema of a resource:

GET /api/{model_type}/{model_name}/schema/?format=json&hierarchy=pkid

All the schemas are in JSON format.

To see a specific resource API schema, refer to the API Reference page for the resource in the API Reference material on the documentation portal.

8.3. Notifications

VOSS Automate APIs support sending out notifications when instances of certain models are added or changed. For more details on which models are supported for notifications, and how to configure these notifications please refer to the topics on:

- Alerts in the VOSS Automate Core Feature Guide
- SNMP Traps in the Platform Guide

8.4. Meta data

8.4.1. Metadata

The metadata of a resource provides:

- tags: List of instance tag names for tag management, see API Parameters.
- version_tag: List of version tags for version tag management, see API Parameters.
- model type: The complete model type with name.
- references: Information of how this resource relates to other resources
- summary_attrs: Summary attributes used for list views.
- actions: The actions that can be performed in this resource
- path: The hierarchy (business node) path to the existing resource
- singleton: If set, instances of the resource can be restricted to one per system or hierarchy.

These are discussed in more detail elsewhere in this guide.

8.4.2. References

References in the system represent the reference of an entity in the system as Hypermedia as the Engine of Application State (HATEOS). Each reference position is represented by an object pair pkid and href.

- device: A list of one device that relates the resource to a device resource in the system.
- **owner**: The owner reference would exist if the current resource was created by a Domain Model (feature model)
- **self**: A list of containing a reference to the current resource.
- parent (reserved for hierarchy): An entry containing the parent in the hierarchy: zero for root node, one for other resources.
- **children** (reserved for hierarchy): A list of zero or more children in the hierarchy tree below the resource.

For example:

```
"references": {
    "device": [{
        "pkid": "",
        "href": ""
    }],
    "owner": [{
        "pkid": "".
        "href": ""
    }],
    "self": [{
        "pkid": "5135fc0f31790a3000a83b2b".
        "href": "/api/data/CallManager/5135fc0f31790a3000a83b2b"
    }],
    "children": [],
    "parent": [{
        "pkid": "5135fb8331790a2ffee7d7ab".
        "href": "/api/data/HierarchyNode/5135fb8331790a2ffee7d7ab"
    }]
}
```

8.4.3. Summary Attributes

For resources that will be displayed on the GUI as a summarized list, data fields can be selected for this list. Members of the **summary attr** list identify:

• title as the list column header on the GUI display

Note: If the default Field Display Policy for the resource contains a value, this will be displayed in the column header.

name as the resource field to show in the column of the list

For example:

94

```
summary_attrs: [
    {
      title: "Name"
      name: "name"
    }
    {
      title: "Description"
      name: "description"
    }
}
```

8.4.4. Path

The **path** object in the meta of a specific resource contains the list of parent pkid values in the hierarchy sequence to which the resource belongs. This list represents the navigation path from the root node of the hierarchy to the specific resource.

Example

```
path: [
  "50c1e21fa61654441dd8edc4",
  "50c1e2a2a61654441eaebcf8",
  "50c1e2a4a61654441eaebcfe",
  "50c1e2a6a61654441eaebd01"
]
```

In the example above, the path to the current resource node is:

```
"50cle21fa61654441dd8edc4" (ancestor)

--> "50cle2a2a61654441eaebcf8" (ancestor)

--> "50cle2a4a61654441eaebcfe" (parent)

--> "50cle2a6a61654441eaebd01" (current node)
```

8.4.5. Model Type

Model type is referenced from **model_type** in the schema. The reference is to the type of model and the model name - see: model_type .

Example

"data/CallManager" in

8.4.6. Actions

The actions in the metadata of a resource schema provide HTTP method calls to a resource for a number of purposes. The available actions in the schema depend on whether the call request is:

- to a specific resource, i.e. pkid is specified in the call, or
- to the resource in general, i.e. no pkid in the call
- the actions contain a schema property to indicate which requests will support asynchronous transaction handling. This behavior is controlled by the nowait parameter in the URL.

8.4.7. Singleton

The Data model type resource called data/Datamodel has an attribute singleton that can take any of 3 values:

- · None (default): no singleton constraint
- · system: a system singleton that only allows one instance throughout the system
- · hierarchy: a hierarchy singleton that only allows one instance every hierarchy

For example, the snippet below shows a simple data/Datamodel instance called LoginBanner that can itself only have one instance per hierarchy:

```
"data": {
    "doc": "doc",
    "Meta": {
        "operations": [
            "add",
            "clone".
            "export",
            "export_bulkload_template".
            "get",
            "help",
            "move",
            "list",
            "migration",
            "transform",
            "remove",
            "tag",
            "tag_version",
            "update",
            "field_display_policy"
        ],
        "summary_attrs": [
            "login_banner"
        ],
        "singleton": "hierarchy",
        "attr_props": [
            {
                 "title": "Login Banner",
                 "required": true,
```

8.5. Generic Actions

8.5.1. Choices Generic Action

Format:

```
GET http://<server_address>/api/<resource_type>/<resource_name>/choices/
?hierarchy=[hierarchy]
&format=json
```

| Action | choices |
|---------------|--|
| Description | Get a list of resource instances at a hierarchy as value-title pairs. Requires a business key in the resource model definition. |
| Method | GET |
| URL | /api/ <resource_type>/<resource_name>/choices/ or without resource specification: /api/choices/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], format=json, pagination parameters (see API Parameters), filter parameters (see Filter Parameters for Choices). |
| Response | A JSON payload with: pagination details meta information: query, list of instance references with pkid and href of data choices data: list of value-title pairs of the business keys. On the GUI choices list, the response title displays, while the value is returned. Filter parameters can modify this standard behavior - see Filter Parameters for Choices. |
| support_async | false |

Example:

Request

```
GET http://<server_address>/api/data/Countries/choices/
?hierarchy=[hierarchy]
&format=json
```

Response

```
HTTP 200 OK
Vary: Accept
X-Request-ID: 9bcd77b4cd27dccd0f18a1d8d22e7ddab85aa848
Content-Type: text/html; charset=utf-8
Allow: GET, HEAD, OPTIONS
Response-Content:
{
   pagination : {
        direction: asc,
       maximum_limit : 2000,
        skip: 0,
       limit: 0,
       total_limit : null,
        total: 37
   },
   meta : {
        query : /api/data/Countries/choices/,
       references : [
           {
              pkid: 5a16c3c68963f91b84baf357,
              href : /api/data/Countries/5a16c3c68963f91b84baf357/
          },
        ]
    choices : [
        {
           value : ["Australia", "AUS", "hcs"],
           title : ["Australia", "AUS", "hcs"]
        },
```

8.5.2. Add Generic Action

| Action | add |
|---------------|---|
| title | Get the GUI Add form. |
| method | GET |
| URL | /api/ <resource_type>/<resource_name>/add/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], format=json |
| Response | The schema of <resource_type>/<resource_name> as JSON</resource_name></resource_type> |
| support_async | false |
| class | add |

When adding the &schema=1 parameter, the response contains the schema of the payload for the Create action.

The schema required to add the resource may be different from the schema that is used to obtain the details of the resource. Refer to the schema of the GUI Add form.

The actions in the response shows the URL for the POST API call to create an instance (see Create action).

For example, the request below shows the required details. (Using variables [hierarchy])

Request:

```
GET /api/data/AccessProfile/add/
?hierarchy=[hierarchy]
&format=json
&schema=1
```

Response snippet - POST call:

```
"create": {
    "class": "add",
    "href": "/api/data/HierarchyNode/?hierarchy=[hierarchy]",
    "method": "POST",
    "support_async": true,
    "title": "Create"
}
```

Response snippet - schema:

```
"schema": {
   "$schema": "http://json-schema.org/draft-03/schema",
   "properties": {
       "description": {
           "description": "A general description for the hierarchy node.",
           "title": "Description",
           "type": "string"
       },
       "name": {
           "description": "The name by which this hierarchy node will
            be known.",
           "pattern": "^[A-Za-z0-9_\\- ]+$",
           "required": true,
           "title": "Name",
           "type": "string"
       },
       "node_type": {
           "choices": [],
           "description": "A type label for this node which refers
             to a Hierarchy Node Type.",
           "format": "uri",
           "is_password": false,
           "items": {
               "is_password": false
           },
           "readonly": false,
           "required": false,
           "target": "/api/data/HierarchyNodeType/choices/?hierarchy=[hierarchy]",
```

8.5.3. Bulk Update Generic Action

| Action | bulk_update (1) |
|---------------|---|
| title | First task: Obtain the URL and schema needed to construct the payload to modify the resource. |
| method | GET |
| URL | /api/ <resource_type>/<resource_name>/bulk_update/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], format=json |
| Response | Returns: POST call that is used to update the instances of resource schema that is used to create POST payload. |
| support_async | false |
| class | update |

| Action | bulk_update (2) |
|------------|---|
| title | Second task: Perform the bulk modify on the required list of instances each with [pkid] with the payload constructed from the schema in the first task. |
| method | POST |
| URL | /api/ <resource_type>/<resource_name>/bulk_update/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], format=json |
| Payload | Contains update data and instance pkids to update. |

Use the GET request to obtain a list of instance pkids to select for the bulk update:

```
GET /api/<resource_type>/<resource_name>/?hierarchy=[hierarchy]&format=json
```

As an example, the request below shows the required details for a particular model. (Using variables [hierarchy], [pkid1], [pkid2])

Request for POST call and schema:

```
GET /api/data/AccessProfile/bulk_update/
?hierarchy=[hierarchy]
&schema_rules=true
&format=json
&schema=1
```

Response snippet - POST call:

```
"bulk_update": {
    "class": "update",
    "href": "/api/data/AccessProfile/bulk_update/?hierarchy=[hierarchy]",
    "method": "POST",
    "support_async": true,
    "title": "Bulk Modify"
}
```

Response snippet - schema:

```
"schema": {
   "$schema": "http://json-schema.org/draft-03/schema",
   "properties": {
     "description": {
      "description": "A description for the Access Profile.",
      "required": false,
      "title": "Description",
      "type": "string"
     },
     "full_access": {
      "description": "Enabling this flag, grants the user full
        system access.",
       "required": false,
      "title": "Full Access",
      "type": "boolean"
     },
     "miscellaneous_permissions": {
      "description": "The list of miscellaneous operations permitted by
        this Access Profile.",
       "items": {
         "choices": [
             "title": "".
             "value": ""
           }
        ],
         "type": "string"
       },
      "required": false,
       "title": "Miscellaneous Permissions",
       "type": "array"
     },
     "name": {
       "description": "The name that is given to the Access Profile.",
```

```
"required": false,
       "title": "Name \*",
       "type": "string"
    },
    "type_specific_permissions": {
      "description": "The list of types that are permitted by
        this Access Profile.",
      "items": {
        "properties": {
          "operations": {
            "description": "The operations that are permitted by this Access
              Profile for the given type.",
            "items": {
              "choices": [
                  "title": ""
                  "value": ""
                }
              ],
              "type": "string"
            },
            "required": false,
            "title": "Permitted Operations \*",
            "type": "array"
          },
          "type": {
            "choices": [],
            "description": "The type that is permitted by this Access Profile.
              This field supports the use of the * wildcard.",
            "format": "uri",
            "required": false,
            "target": "/api/choices/?hierarchy=[hierarchy]&format=json",
            "target_model_type": "",
            "title": "Permitted Type \*",
            "type": "string"
          }
        },
          "type": "object"
      },
      "required": false,
      "title": "Type Specific Permissions",
      "type": "array"
    }
},
"schema_version": "0.1.8",
"type": "object"
},
```

Example POST request to carry out the update:

```
POST /api/data/AccessProfile/bulk_update/
```

```
?hierarchy=[hierarchy]
&nowait=true
&format=json
```

Payload example - bulk updating the description of instances having pkid1, pkid2 with the string "profile":

8.5.4. Clone Generic Action

| Action | clone |
|---------------|---|
| Title | Clone instance with [pkid]. The schema rules are applied. |
| Method | GET |
| URL | /api/ <resource_type>/<resource_name>/[pkid]/clone/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], schema=true, schema_rules=true |
| Response | A JSON payload with: A POST action URL. The unchanged model [pkid] payload to be modified to create a new instance. |
| support_async | false |
| Class | clone |

• For the instance pkids that can cloned, refer to the List GET call for the resource:

```
GET http://<server_address>/api/<resource_type>/<resource_name>/
?hierarchy=[hierarchy]
&format=json
```

• Use the POST action in the response and a modification of the response as the payload to create the clone of the the instance with pkid.

8.5.5. Configuration Template Generic Action

| Action | configuration_template |
|---------------|--|
| title | Obtain the schema and URL needed to create a Configuration Template instance for the resource. |
| method | GET |
| URL | /api/ <resource_type>/<resource_name>/configuration_template/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy] |
| Response | POST call to create the schema for the configuration template of specified resource. |
| support_async | false |
| class | config |

- Use the returned properties to create the POST payload data for the specified resource.
- For a details on what to add to the POST payload, see the schema in the response.
- · The POST call is of the format:

```
POST http://<server_address>/api/data/ConfigurationTemplate/
?hierarchy=sys
```

For example, the request:

```
GET /api/data/AccessProfile/configuration_template/
?hierarchy=[hierarchy]
&format=json
&schema=true
&schema_rules=true
```

The response includes the required POST call:

```
"create": {
   "class": "add",
   "href": "/api/data/ConfigurationTemplate/?hierarchy=[hierarchy]",
   "method": "POST",
   "support_async": true,
   "title": "Create"
}
```

The response includes the Configuration Template schema for the relevant model. The template property of the schema applies to the relevant model. This schema is used to create a payload for the POST.

A simple example of a payload containing a Configuration Template for a model data/AccessProfile with name "CFT1" that adds a value to the Access Profile description "Access Profile for:":

```
{"data":
{"name":"CFT1",
"target_model_type":"data/AccessProfile",
"merge_strategy":"additive",
(certifices on next page)
```

(continued from previous page)

```
"template":{
    "description":"Access Profile for:"}
},
"request_meta":{},
"meta":{
    "references":{
        "form_href":"/api/data/AccessProfile/configuration_template/
           ?hierarchy=[hierarchy]"
     }
}
```

8.5.6. Create Generic Action

| Action | create |
|---------------|--|
| title | Create an instance of a resource. |
| method | POST |
| URL | /api/ <resource_type>/<resource_name>/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy] |
| Payload | See add schema of the object for the payload specification |
| support_async | true |
| class | add |

Response is a pkid of the created instance.

To obtain the schema of the resource, use the GET request:

```
GET /api/<resource_type>/<resource_name>/
?hierarchy=[hierarchy]
&format=json
```

To apply a configuration template when creating the resource, use the parameter &configuration_template with its value the name of an existing Configuration Template. For details on the parameter, refer to the topic on API parameters.

8.5.7. Delete Generic Action

| Action | Delete |
|---------------|---|
| title | Delete instance with [pkid] |
| method | DELETE |
| URL | /api/ <resource_type>/<resource_name>/[pkid]/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy] |
| Payload | N/A |
| support_async | true |
| Class | delete |

| Action | Bulk Delete |
|---------------|--|
| Title | Bulk delete [pkid1],[pkid2] |
| Method | DELETE |
| URL | /api/ <resource_type>/<resource_name>/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy] |
| Payload | {"hrefs":["/api/ <resource_type>/<resource_name>/[pkid1]", "/api/<resource_type>/<resource_name>/[pkid2]",]}</resource_name></resource_type></resource_name></resource_type> |
| support_async | true |
| Class | delete |

For the instance pkids [pkid1],[pkid2], ... that can be added to the DELETE call payload (the instance pkids to delete), use to the GET call for the resource.

```
GET /api/<resource_type>/<resource_name>/
?hierarchy=sys
&format=json
```

8.5.8. Execute Generic Action

| Action | Execute (instance) |
|---------------|--|
| Title | Execute |
| Method | POST |
| URL | /api/ <resource_type>/<resource_name>/execute/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy] |
| Support Async | true |
| Class | execute |

For example, execute a data synchronization action for a device. In this case, the call would be:

```
POST /api/data/DataSync/[pkid]/execute/
?hierarchy=[hierarchy]
&nowait=true
&format=json
```

And for a device data/CallManager, the payload would be similar to:

```
{
    "data": {
        "asynchronous": false,
        "device_type": "data/CallManager",
        "model_type_list": "minimum CUCM models",
        "name": "minimum CUCM models",
        "refresh_existing_data": true,
        "sync_type": "pull"
    },
    "meta": {
        "references": {
            "form_href": "/api/data/DataSync/[pkid]/
             ?hierarchy=[hierarchy]"
        }
    "request_meta": {}
}
```

8.5.9. Export Generic Action

| Action | export (instance) |
|---------------|--|
| Task | Get a selected [export_format] of the schema and a single instance with [pkid] of <resource_type>/<resource_name>; optionally with tag_version at [version] and Configuration Template as [configuration].</resource_name></resource_type> |
| Call | GET |
| URL | /api/ <resource_type>/<resource_name>/export/[pkid]/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], version=[version], export_format=[raw_xlsx xlsx json], schema=, schema_rules=, template_name=[configtemplate] |
| Response | The response is an attachment: a compressed zip of the JSON file |
| support_async | false |
| Class | export |

For export_format=raw_x1sx, the response is a "raw" MS Excel spreadsheet with columns corresponding to the JSON format export and response format:

```
Content-Disposition: attachment;
filename=<resource_type>_<resource_name>_exportedsheet_CCYY-MM-DD_HH-MM-SS.xlsx
(continues on next page)
```

(continued from previous page)

```
Content-Language:en
Content-Type:
application/vnd.openxmlformats-officedocument.spreadsheetml.sheet
```

For export_format=xlsx, the response is a MS Excel spreadsheet, formatted to show all columns and response format:

For export_format=json, the response is a time stamped zip file of data in JSON and a response format:

```
Content-Disposition: attachment;
  filename=export_CCYY-MM-DD_HH:MM:SS.MS.json.zip
Content-Language:en
Content-Type:application/x-zip
```

The XLSX format can be used to bulk load instances of the resource and the JSON format can be used to import instances of the resource.

| Action | Bulk Export |
|---------------|---|
| Title | Get a selected [export_format] the schema and instances [pkid1], [pkid2], of the resource; optionally with tag_version at [version] and Configuration Template as [configtemplate]. |
| Method | POST |
| URL | /api/ <resource_type>/<resource_name>/export/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], version=[version], ex- port_format=[raw_xlsx xlsx json], schema=, schema_rules=, template_name=[configtemplate] |
| Payload | {"hrefs": ["/api/ <resource_type>/<resource_name>/[pkid1]", "/api/<resource_type>/<resource_name>/[pkid2]",]}</resource_name></resource_type></resource_name></resource_type> |
| support_async | true |
| Class | export |

For export_format=raw_xlsx, the response is a MS Excel spreadsheet and response format:

```
Content-Disposition: attachment;
  filename=<resource_type>_<resource_name>_exportedsheet_CCYY-MM-DD_HH-MM-SS.xlsx
Content-Language:en
Content-Type:
  application/vnd.openxmlformats-officedocument.spreadsheetml.sheet
```

For export_format=x1sx, the response is a MS Excel spreadsheet and response format:

For export_format=json, the response is a time stamped export zip file and a response format:

```
Content-Disposition: attachment;
filename=export_CCYY-MM-DD_HH:MM:SS.MS.json.zip
Content-Language:en
Content-Type:application/x-zip
```

The XLSX format can be used to bulk load instances of the resource and the JSON format can be used to import instances of the resource.

To get the list of all instance pkids [pkid1],[pkid2], ..., use the List action of the resource:

```
GET http://<server_address>/api/<resource_type>/<resource_name>/
  ?hierarchy=sys
```

8.5.10. Export BulkLoad Template Generic Action

| Action | export_bulkload_template |
|---------------|--|
| Title | Get a compressed file of the Bulk Load spread sheet template for the resource, optionally with a Field Display Policy as [policy] or Configuration Template as [configtemplate]. |
| Method | POST |
| URL | /api/ <resource_type>/<resource_name>/export_bulkload_template/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], policy_name=[field_display_policy], tem- plate_name=[configtemplate], schema=, schema_rules= |
| Response | The response is an attachment of the format: <resource_type>_<resource_name>_bulkloadsheet.xlsx</resource_name></resource_type> |
| support_async | true |
| Class | export |

Example request:

```
POST /api/data/DATA1/export_bulkload_template/
?hierarchy=[hierarchy]
&template_name=[configtemplate]
&policy_name=[field_display_policy]
&schema=
&schema_rules=
&format=json
```

Example response:

```
HTTP/1.1 200 OK
Server: nginx/1.1.19
Date: Mon, 09 Mar 2015 15:13:06 GMT
Content-Type: application/vnd.openxmlformats-officedocument.spreadsheetml.sheet
Transfer-Encoding: chunked
Connection: keep-alive
Vary: Accept, Cookie, Accept-Language
Content-Language: en-us
Allow: POST, OPTIONS
Content-Disposition: attachment; filename=data_DATA1_bulkloadsheet.xlsx
```

The returned spreadsheet will reflect the applied Configuration Template and Field Display Policy as indicated in the POST parameters.

8.5.11. Field Display Policy Generic Action

| Action | field_display_policy |
|---------------|---|
| title | Obtain the schema and URL needed to create a Field Display Policy instance for the resource. |
| method | GET |
| URL | /api/ <resource_type>/<resource_name>/field_display_policy/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy] |
| Response | Field Display Policy schema and rules that include the POST and a reference to the target model used to create the field display policy for the resource. |
| support_async | false |
| class | display_policy |

• Use the action in the response to create the POST payload for the specified resource.

The response snippet below shows the POST method to create the Field Display Policy:

• The Field Display Policy schema in the response shows properties to add to the POST payload.

Example POST payload for target model data/DATA1 (from an Admin Portal form with [form_FDP] and [form_CFG] applicable):

```
{
  "data": {
    "field_overrides": [
       "field": "name",
       "help_text": "Help Name"
    ],
    "groups": [
      {
       "fields": [
        "name",
        "surname"
       "title": "G1"
      }
    ],
    "name": "FDP2",
    "target_model_type": "data/DATA1"
  },
  "meta": {
    "references": {
      "form_href": "/api/data/DATA1/field_display_policy/
       ?hierarchy=[hierarchy]
       &policy_name=[form_FDP]
       &template_name=[form_CFG]"
    }
 },
  "request_meta": {}
}
```

8.5.12. Help Generic Action

| Action | help |
|---------------|--|
| Title | Get the on-line Help for the resource. |
| Method | GET |
| URL | /api/ <resource_type>/<resource_name>/help</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy] |
| Response | On-line help of the resource as HTML |
| support_async | false |
| class | help |

8.5.13. List Generic Action

| Action | list |
|-----------------|--|
| title | List the resources of a given type in the system. |
| method | GET |
| URL | /api/ <resource_type>/<resource_name>/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], format=json. The schema is returned irrespective of whether the parameter &schema=true is sent. |
| Response method | The <resource_type>/<resource_name> schema and all instances in JSON format.</resource_name></resource_type> |
| support_async | false |
| class | list |

8.5.14. Update Generic Action

| Action | update (instance) (same for modify) |
|---------------|--|
| title | Modify an instance of a resource |
| method | PUT |
| URL | /api/ <resource_type>/<resource_name>/[pkid]</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy] |
| Payload | See the schema of the resource for the payload specification |
| support_async | true |
| class | update |

The update action replaces current resource values with the payload values. The payload should contain the all the attributes in schema.

The response is a pkid of the updated instance.

To apply a configuration template when creating the resource, use the parameter &configuration_template (for further information on the API parameter, see the API Guide).

8.6. Custom Device Connection Actions

8.6.1. Import

| Action | import (instance) |
|------------|---|
| Title | Execute |
| Method | POST |
| URL | /api/ <resource_type>/<resource_name>/import/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy] |
| Support | Async |
| Class | import |

For example, a full synchronization of the VOSS Automate cache with a device.

8.6.2. Test Connect

| Action | test_connect (instance) |
|---------------|--|
| Title | Test Connection |
| Method | POST |
| URL | /api/ <resource_type>/<resource_name>/[pkid]/test_connect/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], format=json |
| Support Async | true |
| Class | test_connection |

8.7. Custom Device Actions

8.7.1. Apply

| Action | apply |
|---------------|---|
| Title | Apply |
| Method | POST |
| URL | /api/ <resource_type>/<resource_name>/[pkid]/+apply/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], format=json |
| View | /api/ <resource_type>/<resource_name>/[pkid]/+apply/schema/</resource_name></resource_type> |
| Support Async | true |
| Class | custom |

8.7.2. **Assign**

| Action | assign |
|---------------|---|
| Title | Assign |
| Method | POST |
| URL | /api/ <resource_type>/<resource_name>/[pkid]/+assign/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], format=json |
| View | /api/ <resource_type>/<resource_name>/+assign/schema/</resource_name></resource_type> |
| Support Async | true |
| Class | custom |

For example, device/cucm/PresenceUser

8.7.3. Do

| Action | do |
|---------------|---|
| Title | |
| Method | POST |
| URL | /api/ <resource_type>/<resource_name>/[pkid]/+do/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], format=json |
| View | /api/ <resource_type>/<resource_name>/+do/schema/</resource_name></resource_type> |
| Support Async | true |
| Class | custom |

Example resources:

- cucm/AuthenticateUser
- cucm/DeviceLogin
- cucm/DeviceLogout
- etc...

8.7.4. Lock

| Action | lock |
|---------------|---|
| Title | Lock |
| Method | POST |
| URL | /api/ <resource_type>/<resource_name>/[pkid]/+lock/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], format=json |
| View | /api/ <resource_type>/<resource_name>/+lock/schema/</resource_name></resource_type> |
| Support Async | true |
| Class | custom |

For example, a cucm phone.

8.7.5. **Promote**

| Action | promote |
|---------------|--|
| Title | Promote |
| Method | POST |
| URL | /api/ <resource_type>/<resource_name>/[pkid]/+promote/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], format=json |
| View | /api/ <resource_type>/<resource_name>/+promote/schema/</resource_name></resource_type> |
| Support Async | true |
| Class | custom |

8.7.6. Reset

| Action | reset |
|---------------|--|
| Title | Reset |
| Method | POST |
| URL | /api/ <resource_type>/<resource_name>/[pkid]/+reset/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], format=json |
| View | /api/ <resource_type>/<resource_name>/+reset/schema/</resource_name></resource_type> |
| Support Async | true |
| Class | custom |

8.7.7. Vendor Config

| Action | vendor_config |
|---------------|--|
| Title | Vendor Config |
| Method | POST |
| URL | /api/ <resource_type>/<resource_name>/[pkid]/+vendor_config/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], format=json |
| View | /api/ <resource_type>/<resource_name>/+vendor_config/schema/</resource_name></resource_type> |
| Support Async | true |
| Class | vendor_config |

8.7.8. Wipe

| Action | wipe |
|---------------|---|
| Title | Wipe |
| Method | POST |
| URL | /api/ <resource_type>/<resource_name>/[pkid]/+wipe/</resource_name></resource_type> |
| Parameters | hierarchy=[hierarchy], format=json |
| View | /api/ <resource_type>/<resource_name>/+wipe/schema/</resource_name></resource_type> |
| Support Async | true |
| Class | custom |

8.7.9. Update LDAP Authentication

| Action | update_ldap_auth |
|---------------|---|
| Title | Set up device/cucm/LdapAuthentication before import. Also use this call for update. |
| Method | POST |
| URL | /api/device/cucm/LdapAuthentication/+update_ldap_auth/ |
| Parameters | hierarchy=[hierarchy], format=json |
| Support Async | true |
| Class | custom |

For payload, see device/cucm/LdapAuthentication schema.

8.7.10. Update LDAP System

| Action | update_ldap_system |
|---------------|---|
| Title | Set up device/cucm/LdapSystem before import. Also use this call for update. |
| Method | POST |
| URL | /api/device/cucm/LdapSystem/+update_ldap_system/ |
| Parameters | hierarchy=[hierarchy], format=json |
| Support Async | true |
| Class | custom |

For payload, see device/cucm/LdapSystem schema.

8.8. Other elements

8.8.1. Data

The data of a resource is an object containing all the required and set fields of a model.

The data instance shows names as they are defined in the schema of the resource while the values of the names are contained in the instance.

Example of a single data instance of a resource of model type data and model name CallManager.

```
data: {
    iso_country_code: "AUS"
    pkid: "51ef319c746fae3622c710e4"
    pstn_access_prefix: "9"
    service_access_prefix: "13"
    default_user_locale: "English United States"
    network_locale: "United States"
    premium_access_prefix: "8"
    international_access_prefix: "011"
    country_name: "Australia"
    international_dial_code: "61"
    emergency_access_prefix: "000"
    national_trunk_prefix: "0"
    hierarchy_path: "sys"
}
```

8.8.2. Resources

The **resources** object in a resource list is represented as a list of objects containing meta and data of resources of the requested model type and model name.

Below and example of a **resources** object outline.

```
"resources": [{
    "meta": { ... },
    "data": { ... }
},
{
    "meta": { ... },
    "data": { ... }
},
...
]
```

8.8.3. Schema

You can obtain the schema for a resource in the request parameter: ?format=json&schema=true. This way of requesting the schema is only available when requesting an Add form or when viewing a resource.

A specific URI is also available for obtaining the schema of a resource:

GET /api/(str:model_type)/(str:model_name)/schema/?format=json&hierarchy=pkid

The JSON schema uses the IETF draft-zyp-json-schema-03 (http://tools.ietf.org/html/draft-zyp-json-schema-03 and https://github.com/json-schema/json-schema)

The schema provides the properties of a field for each object in the schema describing the data of a resource:

- \$schema: The schema URI, currently http://json-schema.org/draft-03/schema.
- title: This is the default field name.
- required: The property and value true value is a property if the field is mandatory
- type: The data type of the field. See the definitions and conventions in use. If the data type is:
 - object, then the object itself has a schema
 - array, then it has the property items
- format: if the type is string, a further format of the string can be selected.
- choices: In the case that the data element takes a value from a specified list of values.
- target: where a resource is linked to another resource, this resource is indicated as the target.
- target_attr: the specific attribute of the target.
- attr_props: an object containing the list of properties of each attribute.
- minitems: minimum number if the data type is an array.
- maxItems: maximum number if the data type is an array.
- items: the specified items if the data type is an array.
- documentation and description: text content to document and describe the object.

- name: name of the resource. [a-zA-Z_] characters are allowed
- · default: default value, if specified.
- valid_re: the regular expression that a string data type should adhere to.

Example

Refer to the example data as in Data. The schema for the example data provides properties of each element:

```
schema: {
$schema: "http://json-schema.org/draft-03/schema"
type: "object"
properties: {
host: {
         required: true
         type: "string"
         title: "Host Name"
 }
username: {
          required: true
          type: "string"
          title: "Admin Username"
 }
password: {
          required: true
          type: "string"
          title: "Admin Password"
}
version: {
          target: "/api/data/CallManagerVersion/choices/
            ?hierarchy={hierarchy}&field=version&format=json"
          format: "uri"
          title: "Version"
          choices: [ ]
          target_attr: "version"
          type: "string"
 }
port: {
          type: "string"
          title: "Port"
 }
 import: {
          type: "boolean"
          title: "Immediate Import"
 }
 data_sync: {
          target: "/api/data/DataSync/choices/
            ?hierarchy={hierarchy}&field=name&format=json"
          title: "Data Sync"
          format: "uri"
          choices: [ ]
          target_attr: "name"
          type: "string"
 }
```

(continues on next page)

(continued from previous page)

```
}
```

8.8.4. Pagination

This object contains the **pagination** information of a resource list.

Three fields always exist in this object:

- skip: The offset index into the total resource list to be skipped
- limit: The number of resource to be returned
- **total**: The total number of resources that exist on the system/hierarchy. If a GET call was made with the parameter count=false, then this value will be 0.

Example of a pagination object within a list response.

```
"pagination": {
    "skip": 0,
    "total": 25,
    "limit": 250
}
```

9. OpenAPI Examples

Refer to the "OpenAPI Specification Examples" section in the HTML API Guide

9.1. Getting Started

9.1.1. Introduction to Automate OpenAPI Examples

Overview

This section of the API Guide describes a number of use-cases for integrating with VOSS Automate, based on the OpenAPI specification.

Note: The OpenAPI specification (formerly called Swagger) defines a standard, language-agnostic interface to RESTful APIs. OpenAPI definition files are written in the YAML format, which is automatically rendered into a more human-readable interface.

See https://swagger.io/specification/

You can use the REST API to interact programmatically with Automate and integrate with external applications, such as ServiceNow. For example, you can use the example calls to retrieve a list of all customers at the Provider hierarchy, retrieve a list of all sites belonging to a customer, add a phone or a subscriber, update phone or line details, or delete a phone or a subscriber.

Note: The OpenAPI examples do not support interactive API calls to VOSS Automate.

Errors

The API uses standard HTTP status codes to indicate the success or failure of the API call.

The Automate API uses conventional HTTP response codes to indicate the success or failure of an API request. Codes in the 2xx range indicate success. Codes in the 4xx range indicate an error that failed given the information provided, for example, a required parameter was omitted.

Samples

Each API call has one or more documented examples, for either a response or request (depending on the method, either GET, POST, PATCH, or DELETE).

The body of the response is JSON format.

The response samples provided for the GET call depend on the macro you provide for the call, a sample response is provided for each input macro parameter. Click the drop-down at **Example** to view the response sample for the relevant input macro.

Request samples are similarly provided for each POST, PATCH, and DEL call. Where more than one example is provided, click the drop-down at **Example** to toggle the examples for the call.

You can view the samples, here:

Refer to the "OpenAPI Specification Examples" section in the HTML API Guide.

Content Type

The VOSS Automate API supports the application/json content type by default.

VOSS Automate API and the OpenAPI Specification Examples

These links provide further details relevant to the OpenAPI examples:

• Automate API Guide (this document)

The Automate API Guide provides general information for the Automate API, which you can use as references for the examples in this section:

- What are models?
- What are model types?
- What is the importance of "hierarchy" in the API?
- Request and response patterns
- API URL structure
- Headers
- Authentication
- Authorization
- HTTP methods
- API parameters
- Request headers
- Login and authorization tokens
- API responses
- Optional request metadata
- Using the API Reference
- API schema

· API Model Reference

The API Model Reference provides resource details. Resources are classified by the type of model in the system (data, device, domain, relation or view), for example, data/AccessProfile or device/cucm/Phone.

Depending on the installed modules and their feature packages, the API of feature package models may be available, for example, *relation/Subscriber* or *view/QuickSubscriber*.

The documentation for each API example contains a link to the model reference for that call.

API Reference

The API Reference describes the schema and the operations applicable for each resource in the system. The documentation for each API example contains a link to the API reference for that call.

Refer to the "OpenAPI Specification Examples" section in the HTML API Guide.

9.2. CUCM OpenAPI Examples

9.2.1. GET /tool/Macro

Overview

This section provide details on use case examples with GET tool/macro.

In each case, you will need to specify the organization hierarchy, for example, Provider, Customer, or Site, and provide a macro that specifies the data to retrieve.

All GET calls in this OpenAPI format example point to the same endpoint, tool/macro. You will add a VOSS Automate macro as the input parameter for this endpoint to retrieve the information you require.

The following is a basic example of the syntax of a GET request, using a macro as the input parameter, to a fictional Automate endpoint:

```
GET https://<hostname>/api/tool/Macro/
   ?hierarchy=<hierarchy>
   &method=evaluate
   &input='<macro>'
```

Refer to the link below to view full details around the syntax, parameter values, and response samples related to the combination of endpoint (GET tool/macro) and various macro input parameters used for retrieving data associated to the macro:

Refer to the "Open API Specification Examples" section in the HTML API Guide.

(GET) Customers

Fetches a list of customers and their details, in UC deployments.

Customer data is held in the following fields in VOSS Automate:

| Field | Description |
|---------------|--|
| Short Name | The name of the customer. |
| Extended Name | An extended version of the customer name. |
| Deal ID | The external reference ID for the customer |

Two scenarios are provided:

- UC deployment with Cisco HCM-F
- UC deployment without Cisco HCM-F

(GET) Customers (with HCM-F)

Looks up an external reference used for customers, in a *Cisco HCM-F* deployment. The external reference ID is stored in device.hcmf.Customer.dealIDInfo (Automate field) for each customer.

Note: Other fields in device.hcmf.Customer (Automate table/model) may also be used for storing external references and can also be looked up using this same method.

Example 1: Fetch a list of all customers and their external IDs

Query parameters:

- · Hierarchy: Provider
- · Input: None
- Macro:

```
{# device.hcmf.Customer.shortName,extendedName,dealIDInfo | type: Customer #}
```

Example 2: Pass a customer's external ID and fetch details for that customer only

- Hierarchy: Provider
- · Input: DealIDInfo
- Macro:

```
{# device.hcmf.Customer. shortName,extendedName | dealIDInfo:01150015 | type:

Gustomer #}
```

(GET) Customers (without HCM-F)

Looks up an external reference used for customers, in a *non-Cisco HCM-F* deployment. The external reference ID is stored in data.HCSHcmfCustomerDAT.dealIDInfo (Automate field), for each customer.

Note: Other fields in data.HCSHcmfCustomerDAT (Automate table/model) can also be used for storing external references and can also be looked up, using this same method.

Example 1: Fetch the list of all customers and their respective external IDs

Query parameters:

· Hierarchy: Provider

· Input: None

· Macro:

{# data.HCSHcmfCustomerDAT.shortName,extendedName,dealIDInfo #}

Example 2: Pass a customer's external ID and fetch information for that customer only

Query Parameters:

Hierarchy: Provider

· Input: DealIDInfo

Macro:

{# data.HCSHcmfCustomerDAT.shortName,extendedName | dealIDInfo:<Reference ID>#}

(GET) All Sites Belonging to the Customer

Passes the customer name to fetch a list of all sites (locations) in the system that belong to the specified customer.

Note: You can use this macro to dynamically populate the list of sites in the ServiceNow form, enabling the user to select the site where the standalone phone needs to be provisioned.

Query parameters:

· Hierarchy: Site

· Input: Customer Name

Macro:

{# device.hcmf.CustomerLocation.shortName | bkCustomer_shortName:<CustomerName> #}

(GET) Directory Numbers

Fetches all directory numbers that are at a specific site, regardless of whether the numbers are available or used.

Query parameters:

Hierarchy: SiteInput: None

Macro:

```
{# data.InternalNumberInventory.internal_number,e164number,description,status,usage
→#}
```

(GET) Next Available Number

Fetches the next available (unused) directory number (DN) in the site.

Automate maintains the availability and status in the internal number inventory (INI). The API call uses the flags set in the INI table to fetch the relevant information.

Query parameters:

Hierarchy: SiteInput: None

· Macro:

```
{{ fn.one data.InternalNumberInventory.internal_number | status:Available | ↓ →direction:up }}
```

(GET) Phone Models

Fetches phone model information. Two options are provided:

- · Fetch all phone models currently available to a customer
- Fetch all phone models currently offered to customers by the Provider

(GET) All phone models currently available to a customer

Fetches all phone models that are currently available to a customer.

Note: This is useful where a Provider supplies a selection of phone models for different customers, rather than a general list of phone models for all of its customers.

Query parameters:

· Hierarchy: Customer

• Input: None

Macro:

```
{{ data.PhoneConfigMapping.profiles.*.profile_name | name:Default }}
```

Note: Ensure that data. PhoneConfigMapping.profiles is cloned from the *sys* or *provider* level to the *customer* level, and only retain the device types that are offered to the customer.

(GET) All phone models currently offered to customers by the provider

Fetches all phone models that are currently offered to customers by the Provider. The user selects a phone model from the dynamically populated list, to be used in the next transaction.

Query parameters:

· Hierarchy: Customer or Site

• Input: None

• Macro:

(GET) All Phones Belonging to a Customer (with PKIDs)

Fetches the following details for all phones belonging to a customer, with their PKIDs:

| Phone detail | Notes | | |
|-----------------------------|---|--|--|
| PKID | PKID is the database record reference of the phone in phone model (table) that will be used for modification or deletion. | | |
| MAC Address | | | |
| Phone Model | | | |
| Phone Description | | | |
| Phone Owner (if associated) | | | |
| Line settings | For example: • Line Display • Line Display ASCII • Line Label • Line Recording | | |

Query parameters:

· Hierarchy: Customer (or) Site

· Input: None

• Macro:

```
{# device.cucm.Phone.__pkid,name,product,description,ownerUserName,lines.line.index,
→lines.line.dirn.pattern,lines.line.dis play,lines.line.displayAscii,lines.line.
→label,lines.recordingFlag,lines.recordingMediaSource,lines.recordingProfileName #}
```

(GET) Subscriber PKID and Name

Fetches the PKID, user ID, first name, and last name of all users at the customer or site hierarchy.

Query parameters:

- · Hierarchy: Customer (or) Site
- · Input: None
- Macro:

```
{# device.cucm.User.firstName,userid,__pkid,lastName #}
```

(GET) All Phones

Fetches all phones at a specified hierarchy.

Query parameters:

```
* Hierarchy: Customer (or) Site
* Input: None
* Output(s): Phone MAC Address, Details of Phone
* Macro
```

customer hierarchy:

```
{{ fn.get_phone_choices ,,,down }}
```

site hierarchy:

```
{{ fn.get_phone_choices ,,,local }}
```

(GET) All Phones Belonging to a Subscriber

Fetches all phones that belong to a specified user.

- · Hierarchy: Site
- · Input: Userid
- · Macro:

(GET) All Phones Without Associated User

Fetches all phones at a site that do not have a owneruserid; that is, unassociated phones.

Query parameters:

- · Hierarchy: Site
- · Input: None
- Output values: Phone MAC Address, Phone Description
- Macro:

```
{# device.cucm.Phone.name,description | ownerUserName:null | direction:local #}
```

(GET) All DeviceProfiles Without Associated User

Fetches all Cisco Unified Device Profiles (UDP) at a site that are not associated to a user.

Query parameters:

- · Hierarchy: Site
- · Input: None
- · Output value(s): UDP Name
- · Macro:

```
{# fn.list_set_left macro.DEVICEPROFILE_LIST, macro.PHONEPROFILE_LIST_FLATTENED #}
```

(GET) All Line Details

Fetches all lines at a specified hierarchy.

- · Hierarchy: Customer (or) Site
- · Input: None
- Output(s): Line record PKID, Line Pattern, Line Description, Line AlertingName, Line ASCIIAlerting-Name
- · Macro:

```
{# device.cucm.Line.__pkid,pattern,description,alertingname,asciialertingname #}
```

(GET) Subscribers Lines

Fetches all lines that belong to a subscriber.

Query parameters:

- · Hierarchy: Customer (or) Site
- · Input: User name
- Macro:

```
{{ fn.get_associated_lines <username> }}
```

(GET) Supported Protocols

Fetches all the protocols that a specified phone model supports.

Query parameters:

- · Hierarchy: Customer
- · Input: Phone Model
- · Macro:

```
{{device.cucm.PhoneType.ProtocolTemplates.*.Protocol | PhoneType:<Phone Model> | _ _ direction:up, device:macro.SITE_CUCM }}
```

(GET) Phone Button Templates for Phone Model

Fetches all the Phone Buttons Templates that are available in the system for a specified phone model.

Query parameters:

- · Hierarchy: Customer
- · Input: Phone Model, Protocol
- Macro

```
{{ device.cucm.PhoneType.ProtocolTemplates.*.PBT| PhoneType:<Phone Model>,_____
ProtocolTemplates.*.Protocol:<Phone Protocol> | direction:up, device:macro.SITE_____
CUCM }}
```

(GET) Security Profiles for Phone Model

Fetches all the available security profiles for a specified phone model.

- · Hierarchy: Customer
- · Input: Phone Model, Protocol
- Macro:

```
{{ device.cucm.PhoneType.ProtocolTemplates.*.SecurityProfile | PhoneType:<Phone_
→Model>, ProtocolTemplates.*.Protocol:<Phone Protocol> | direction:up, device:macro.
→SITE_CUCM }}
```

(GET) Subscriber's Phones and Services

Fetches the details of existing phones, lines, and services of a subscriber. You can use these details to assign further services to a subscriber or to move a subscriber between sites.

Query parameters:

- · Hierarchy: Customer
- Input: username
- · Macro:

```
{{ fn.movesub_getguirules_on_username_change <username> }}
```

(GET) Available Hierarchies of a Customer

Fetches all the available hierarchy paths for a specified customer.

Query parameters:

- · Hierarchy: Customer
- · Input: None
- · Macro:

```
{# fn.friendly_path_choices,down #}
```

The output provides the customer hierarchy and site hierarchies.

(GET) Usernames at Customer and Downwards

Fetches all usernames at the customer hierarchy, and below.

- · Hierarchy: Customer
- Input: None
- Macro:

```
{{ fn.list_end_user_names down, fn.null }}
```

(GET) User Details

Fetches a user's username, first name, last name, email, and sync_type.

Query parameters:

Hierarchy: SiteInput: Username

Macro

```
{# data.User.username,first_name,last_name,email,sync_type | username: <username> #}
```

(GET) Customer Common Phone Configs

Fetches the names of all Common Phone Configs.

Query parameters:

· Hierarchy: Customer

· Input: None

• Macro:

```
{# device.cucm.CommonPhoneConfig.name #}
```

(GET) Available Quick Add Groups

Fetches all Quick Add Groups available at a site. This will be used in Quick Add Subscriber.

Query parameters:

· Hierarchy: Site

· Input: None

Macro

```
{# data.QuickAddGroups.group_name || direction:up, to:Hcs #}
```

(GET) Unassociated Phones of Specific Model at Site

Fetches all unassociated phones of a specified model and protocol, at a site.

Query parameters:

· Hierarchy: Site

• Input: Phone Model, Phone Protocol

Note: This query is used to pre-populate the Phone MAC Address field in Quick Subscriber.

Macro

{{ fn.get_phone_choices <Phone Model>,<Phone Protocol>,null,up }}

9.2.2. Add a standalone Cisco phone

Overview

This API POST call adds a standalone Cisco phone.

POST https://<hostname>/api/api/view/AddPhone

References:

- OpenAPI example for view/AddPhone
- · Model: view/AddPhone
- API Reference for view/AddPhone

Using POST AddPhone

The API call involves the following tasks:

- 1. Identify the customer and customer hierarchy, and the site and site hierarchy.
- 2. Provide phone details:
 - Phone MAC address
 - · Phone model
 - · Phone description
- 3. Provide line details:
 - · Directory numbers
 - · Line labels
 - Display names

Step 1: Identify Customer+Customer Hierarchy and Site+Site Hierarchy

 Fetch the list of customers and populate a drop-down list. Allow the operator to select a customer from the list. <Customer Name>

Refer to (GET) Customers for deployments with or without HCM-F.

2. Fetch available site hierarchies for the selected customer (<Customer Name>). Allow the operator to select the site where the phone will be added.

Refer to (GET) All Sites Belonging to the Customer

- 3. Resolve <Customer Hierarchy> and <Site Hierarchy>.
 - \bullet <Customer Hierarchy> is the entry in the earlier step that ends with the <Customer Name>.

For example, if <Customer Name> is Innovia, the <Customer Hierarchy> will be sys.hcs.CS-P. CS-NB.Innovia.

• <Site Hierarchy> is the entry in the earlier step that the operator selects.

For example, sys.hcs.CS-P.CS-NB.Innovia.INV-Reading, sys.hcs.CS-P.CS-NB.Innovia.INV-New York

Step 2: Provide phone details

- 1. Fill out a phone description <PhoneDescription> for the description field.
- 2. Select a phone model:
 - Populate device_type with phone models currently available to the customer.
 Refer to (GET) Phone Models by passing <Customer Hierarchy>.
 - User chooses a phone model, and the choice is resolved into <PhoneModel>.
- 3. Fill out the MAC address of the new phone in the name field.

Note: Note the input conditions for MAC address in the OpenAPI example for view/AddPhone

Step 2: Provide line details

1. List all available directory numbers (DN) to populate lines.

Refer to (GET) Directory Numbers.

2. User chooses a directory number (directory_number).

Note: Multiple lines can be added to one phone. Two or more lines can be ordered $1,2,\ldots$ $(<line_{-}(n)>).$

- 3. For each directory number selected, user fills out:
 - A line label (label: <Label (n)>)
 - A display name (display: <Display Name (n)>)

Note: Note the input conditions in the OpenAPI example for view/AddPhone

| Parameter | Value |
|-----------|-------|
| hierarchy | Site |

Request Payload (Body)

The box lists all parameters that could be included in the call request. These parameters are described in the table below the box:

```
{
   "standalone": true,
   "name": "<MACAddress>",
   "device_type": "<PhoneModel>",
   "description": "<PhoneDescription>",
   "lines": [
      {
         "directory_number": "<line_1>",
         "label": "<Label 1>",
         "display": "<Display Name 1>"
      }
   ],
   "request_meta": {
   "external_id": "<id>",
   "external_reference": "<Reference>",
   "callback_url": "<url_string>",
   "callback_username": "<callback_username>",
   "callback_password": "<callback_password>"
   }
}
```

The table describes the parameters in the request:

| Parameter | Description | Туре | Notes |
|--------------|---|--------|--|
| name | The MAC address or phone name of the new phone. | string | The form field should check the following inputs: Max value: 15 characters The first 3 characters must be SEP Following the first 3 characters, the next 12 characters must consist of hexadecimal characters. |
| device_type | The phone model. | string | A drop-down with available phone types. The operator selects a phone model. |
| description | The phone description. | string | Max value: 30 characters |
| lines | Line details for each line added. | array | Line is populated by listing all directory numbers (DNs) available, and then allowing the user to select a DN. Multiple lines can be added to a phone. Two or more lines can be ordered 1,2, (<line (n)="">) • <directory_number> (Line number) • <label> (Line Label) — User input text field — Value <label (n)=""> — Max characters (for each line added): 30 • <display> (Display Name) — User input text field — Value: <display (n)="" name=""> — Max characters (for each line added): 30</display></display></label></label></directory_number></line> |
| request_meta | Contains callback details. | object | These details enable VOSS Automate to update the status when the initiated transaction is complete. |

9.2.3. Add a Cisco subscriber

Overview

This API POST call creates a new Cisco subscriber.

POST https://<hostname>/api/api/view/QuickSubscriber

References:

- OpenAPI example for view/QuickSubscriber
- · Model: view/QuickSubscriber
- · API Reference for view/QuickSubscriber

Using POST QuickSubscriber

Creating a new Cisco subscriber involves the following tasks:

- 1. Identify the customer and customer hierarchy, and the site and site hierarchy.
- 2. Hardcode the value of lookUpForUser to true in the payload.
- 3. Resolve the user details and credentials.
- 4. Retrieve lines and select the lines to be assigned.
- 5. Retrieve Quick Add Groups.
- 6. Select services for the subscriber.
- 7. Allocate soft phones for the subscriber
- 8. Allocate one or more desk phones for the subscriber

Step 1: Identify Customer+Customer Hierarchy and Site+Site Hierarchy

1. Fetch the list of customers and populate a drop-down list. User selects a customer from the list. <Customer Name>

Refer to (GET) Customers (for deployments with or without HCM-F).

2. Fetch available site hierarchies for the selected customer (<Customer Name>). User selects the site where the subscriber will be added.

Refer to (GET) All Sites Belonging to the Customer

- 3. Resolve <Customer Hierarchy> and <Site Hierarchy>.
 - <Customer Hierarchy> is the entry in the earlier step that ends with the <Customer Name>.

For example, if <Customer Name> is Innovia, the <Customer Hierarchy> will be sys.hcs.CS-P. CS-NB.Innovia.

<Site Hierarchy> is the entry in the earlier step that the operator selects.

For example, sys.hcs.CS-P.CS-NB.Innovia.INV-Reading, sys.hcs.CS-P.CS-NB.Innovia.INV-New York

Step 2: Set lookUpForUser to True in the payload

1. In the payload, hardcode the value for lookUpForUser to true.

Step 3: Resolve user details and credentials

1. Fetch all available users currently in the customer to populate the user_username drop-down.

Refer to (GET) Usernames at Customer and Downwards (Customer hierarchy).

2. The user can either select a value from the drop-down (for LDAP users synced in from CUCM or Active Directory), or they can fill out a username (for local users).

Choose an option, and follow the relevant steps for the use case:

- Option 1: User selects an existing name from the drop-down:
 - a. Resolve <user_username> to the selected value:
 - 1. Run (GET) User Details to fetch the users detail stored in the system, and resolve the returned values to user_firstname, user_lastname and user_email.
 - 2. Does the sync type in the returned data contain the word "LDAP"?
 - Yes. In this case, disable the following fields: username, firstname, lastname, email, and password.

Populate the following fields with the values returned in (GET) User Details

Do not send <user_password> in the payload.

 No. In this case, populate the following fields with the values fetched from (GET) User Details: firstname, lastname, email

Keep these fields enabled to allow the user to change values if they wish.

Keep the password field enabled, allowing the user to fill out a password (which is resolved in <user_password>, in the payload.

- Option 2: User enters a new value for username:
 - a. User inputs values for the following fields: firstname, lastname, email
 - b. Resolve these values to the following: <user_firstname>, <user_lastname>, <user_email>
 - c. User fills out a password (password), which resolves to <user_password>.
- 3. User fills out the voicemail / Extension Mobility PIN in pin, which resolves to <user_vm_em_pin>

Step 4: Retrieve the lines to be assigned

1. List all available directory numbers (DN) to populate lines.

Refer to (GET) Directory Numbers (at the site hierarchy)

Note: Values in the drop-down should be the concatenation of values fetched ("internal_number | e164number | status"). For example, "1084000 | +441184121000 | Available","1084010 | +441184121010 | Used".

2. User chooses a directory number (directory_number).

Note: Multiple lines can be added to one phone. Two or more lines can be ordered 1,2,... (<line_(n)>).

Step 5: Retrieve Quick Add Groups

1. Populate read-only qagroup_name drop-down with values from the system.

Refer to (GET) Available Quick Add Groups

Display that value in the list as default ("78XX Reference Quick Add Group").

2. Set <qag_name> with the default value or a selected value.

Step 6: Select services for the subscriber

· Voicemail service:

If user selects the Voicemail checkbox, set the value for <voicemail> to True
(<voicemail_reqd_true_false> = true)

• Extension Mobility service:

If the user selects the **Extension Mobility** checkbox, set the value for <mobility> to True (<extnmobility_reqd_true_false> = true)

Step 7: Allocate a soft phone for a subscriber

- 1. If the user selects the **Cisco Jabber Phone** checkbox, they can assign one or more jabber devices. Device names are allocated using an API call specific to the device type selected:
 - <android_jabber_device_name>

```
GET https://ucprovision.voss-solutions.com/api/tool/Macro/?method=evaluate&

→input={{ fn.jabber_device_name 'Cisco Dual Mode for Android', <user_username>

→}}
```

<csf_jabber_device_name>

• <ipad_jabber_device_name>

```
GET https://ucprovision.voss-solutions.com/api/tool/Macro/?method=evaluate&

input={{ fn.jabber_device_name 'Cisco Jabber for Tablet', <user_username> }}
```

<iphone_jabber_device_name>

Step 8: Allocate desk phones for a subscriber

- 1. If the user selects the **Allocate Deskphone** checkbox, set the value for <voice> to true, and enable and display the relevant fields.
- 2. Fetch available phone types, and allow the user to select a phone model, which resolves into <deskphone_model>

Refer to (GET) Phone Models (<Site Hierarchy>)

- 3. Once a value is selected for <deskphone_model>, populate the following fields:
 - <phone_protocol>

User selects a phone protocol (<phone_protocol>) from the drop-down. The chosen option is resolved as the value (<deskphone_protocol>)

Refer to (GET) Supported Protocols (using <Site Hierarchy> and <deskphone_model>)

<button_template>

Users selects a phone button template (<button_template>) from the drop-down, which is resolved as the value for <deskphone_pbt_name>

Refer to (GET) Phone Button Templates for Phone Model

"phone_name": "<deskphone_MAC_address>

In the "Phone MAC Address" drop-down, populate unassociated phones that belong to <deskphone_model>, currently in this site.

Refer to (GET) Unassociated Phones of Specific Model at Site

Choose one of the following options:

- User selects one value, which resolves to <deskphone_MAC_address>.
 Alternatively:
- Users fills out a MAC address for <deskphone_MAC_address>.

Note: Note the input conditions for MAC address in the OpenAPI example for view/QuickSubscribe

Query parameters

| Parameter | Value |
|-----------|-------|
| hierarchy | Site |

Request Payload (Body)

The box lists all parameters that could be included in the call request. These parameters are described in the table below the box:

```
{
   "lookUpForUser": true,
   "username": "<user_username>",
   "firstname": "<user_firstname>".
   "lastname": "<user_lastname>",
   "email": "<user_email>",
   "password": "<user_password>",
   "pin": "<user_vm_em_pin>",
   "lines": [
   {
         "directory_number": "<line_1>"
   },
   {
         "directory_number": "<line_2>"
   }
   ],
   "qagroup_name": "<qag_name>",
   "voice": <deskphone_reqd_true_false>,
   "phone_type": "<deskphone_model>",
   "phone_protocol": "<deskphone_protocol>".

| Parameter | Description | Туре | Notes |
|-----------|------------------------------------|------------------|---|
| username | The username. | string | For local users, the operator enters the user details (username, firstname, lastname, and email) in the form. For Active Directory (AD) users, the user details (username, firstname, lastname, and email) are fetched from the system, and the form fields are readonly. |
| firstname | The user's first name. | string | For local users, the operator enters the user details (username, firstname, lastname, and email) in the form. For Active Directory (AD) users, the user details (username, firstname, lastname, and email) are fetched from the system, and the form fields are readonly. |
| lastname | The user's last name. | string | For local users, the operator enters the user details (username, firstname, lastname, and email) in the form. For Active Directory (AD) users, the user details (username, firstname, lastname, and email) are fetched from the system, and the form fields are readonly. |
| email | The user's email address. | string | For local users, the operator enters the user details (username, firstname, lastname, and email) in the form. For Active Directory (AD) users, the user details (username, firstname, lastname, and email) are fetched from the system, and the form fields are readonly. |
| password | The user's password. | string | For local users, the operator enters the user password in the form. For Active Directory (AD) users, the user password is not relevant, and the password field is hidden on the form. |
| pin | Voicemail/ extension mobility PIN. | string | |
| lines | One or more user lines. | array of objects | Multiple lines can be added to a phone, and are ordered 1,2, and so on. "directory_number":"line_1", "directory_number":"line_2", "directory_number": "line_n" |

| Parameter | Description | Туре | Notes |
|-----------------|--------------------------------------|-------------------|---|
| qagroup_name | The Quick Add Group name | string | Part of the desk phone details, which includes qagroup_name, phone_type, phone_protocol, phone_name. |
| voice | Desk phone. | boolean | Defines whether a desk phone is required. <deskphone_reqd_true_false> Default is False.</deskphone_reqd_true_false> |
| phone_type | The phone model. | string | Part of the desk phone details, which includes qagroup_name, phone_type, phone_protocol, phone_name. Displays when "voice": true. |
| phone_protocol | The desk phone protocol. | string | Part of the desk phone details, which includes qagroup_name, phone_type, phone_protocol, phone_name. |
| button_template | The desk phone button template name. | string | |
| phones | One or more phones. | array of objects. | Includes the desk phone MAC address (phone_name) for each of the user's phones. |
| voicemail | Voicemail service | boolean | Defines whether the voice- mail service is required. <voicemail_reqd_true_false> The default is False.</voicemail_reqd_true_false> |
| mobility | Extension mobility service | boolean | Defines whether the extension mobility service is required. <pre><extnmobility_reqd_true_false></extnmobility_reqd_true_false></pre> The default is False. |
| jabber | Jabber service (True/False) | boolean | Allows allocation of soft phones. <jabber_reqd_true_false> The default is False.</jabber_reqd_true_false> |
| jabber_devices | One or more Jabber devices. | array of objects | If <jabber>=True, the list of Jabber devices, specifying a value for <jabber_agent> and <device_name> Four types of jabber devices can be assigned:</device_name></jabber_agent></jabber> |
| request_meta | Callback details. | object | These details enable VOSS Automate to update the status when the initiated transaction is complete. |

9.2.4. Reset a CUCM PIN/password and/or CUC PIN

Overview

This API POST call resets passwords and PINs for the following:

- 1. CUCM (Cisco Unified Communications Manager) PIN, used for extension mobility
- CUCM (Cisco Unified Communications Manager) password for Jabber (if device is associated to a CUCM local user)
- 3. CUC (Cisco Unified Unity) voicemail PIN

POST https://<hostname>/api/api/view/ResetUCPasswordPinVIEW

References:

- OpenAPI Example for view/ResetUCPasswordPinVIEW
- Model: view/ResetUCPasswordPinVIEW
- API Reference for view/ResetUCPasswordPinVIEW

Using POST ResetUCPasswordPinVIEW

Resetting a CUCM PIN/password and/or CUC PIN involves the following tasks:

- 1. Identify the customer and the customer's hierarchy.
- Define whether the password/PIN reset is for CUCM (Extension Mobility PIN and Jabber password) and/or CUC voicemail PIN.
- 3. Resolve the user details and credentials.
- 4. Allow user to fill out a PIN.

Step 1: Identify Customer+Customer Hierarchy

 Fetch the list of customers and populate a drop-down list, and allow the user to select a customer from the list. <Customer Name>

Refer to (GET) Customers (for deployments with or without HCM-F).

2. Fetch available hierarchies for the selected customer (<Customer Name>).

Refer to (GET) Available Hierarchies of a Customer

3. Resolve < Customer Hierarchy>.

<Customer Hierarchy> is the entry from step 2 that ends with the <Customer Name>).

For example, if <Customer Name> is Innovia, the <Customer Hierarchy> will be sys.hcs.CS-P.CS-NB. Innovia.

Step 2: Define whether the password/PIN reset is for CUCM or CUC

- 1. The user is presented with two checkboxes on the GUI, one for CUCM and one for CUC.
 - <cucm_checkbox_boolean>
 - <cuc_checkbox_boolean>
- 2. Users can select one or both checkboxes.

When selected, set the value for the relevant fields to true, else, set to false.

Step 3: Resolve user details and credentials

1. Fetch all available users currently in the customer to populate the user_username drop-down, and allow the user to select a value.

Refer to (GET) Usernames at Customer and Downwards (Customer hierarchy)

2. Fetch user details stored in the system to identify whether it is a LDAP user or a local user.

Refer to (GET) User Details

- Does the sync_type in the data returned contain the word "LDAP"?
 - Yes. Disable the password field, and do bot send cpassword_value in the payload.
 - **No**. Keep the password field enabled, allowing the user to fill out a password, which resolves to cpassword_value in the payload.

Note: Validate form field to only allow numeric values.

Query parameters

| Parameter | Value |
|-----------|-------|
| hierarchy | Site |

Request Payload (Body)

The box lists all parameters that could be included in the call request. These parameters are described in the table below the box:

```
"user": "<username>",
    "cucm": <cucm_checkbox_boolean>,
    "cuc": <cuc_checkbox_boolean>,
    "password": "<password_value>",
    "pin": "<pin_value>",
    "request_meta": {
```

(continues on next page)

(continued from previous page)

```
"external_id": "<id>",
    "external_reference": "<Reference>",
    "callback_url": "<url_string>",
    "callback_username": "<callback_username>",
    "callback_password": "<callback_password>"
}
```

The table describes the parameters in the request:

| Parameter | Description | Туре | Notes |
|--------------|--|---------|---|
| user | The username. | string | |
| cucm | CUCM. | boolean | Defines whether the pass-word/PIN reset is for CUCM. <cucm_checkbox_boolean> Default is False. Set to True to reset a CUCM PIN or password.</cucm_checkbox_boolean> |
| cuc | CUC | boolean | Defines whether the pass-word/PIN reset is for CUC. <cuc_checkbox_boolean> Default is False. Set to True to reset a CUC PIN.</cuc_checkbox_boolean> |
| password | The Jabber password. | string | When value for <cucm_checkbox_boolean> is True, set the Jabber password in <password_value>.</password_value></cucm_checkbox_boolean> |
| pin | The Extension Mobility or Voicemail PIN. | integer | When value for cucm_checkbox_boolean is True, set a numeric PIN for CUCM Extension Mobility and CUC voicemail. |
| request_meta | Callback details. | object | These details enable VOSS Automate to update the status when the initiated transaction is complete. |

9.2.5. Replace a Cisco phone

Overview

This API POST call replaces an existing Cisco phone with a new phone.

POST https://<hostname>/api/api/view/ReplacePhone_VIEW

References:

- OpenAPI example for
- Model: view/ReplacePhone_VIEW
- API Reference for view/ReplacePhone VIEW

Using POST ReplacePhone_VIEW

Replacing a Cisco phone involves the following tasks:

- 1. Identify the customer and customer hierarchy, and the site and site hierarchy.
- 2. Populate a list of existing phones in the site, and allow user to choose the phone to be replaced.
- 3. User provides details for the replacement phone.

Step 1: Identify Customer+Customer Hierarchy and Site+Site Hierarchy

- Fetch the list of customers to populate a drop-down list, and allow the user to select a customer from the list. <Customer Name>
 - Refer to (GET) Customers (for deployments with or without HCM-F).
- 2. Fetch available site hierarchies for the selected customer (<Customer Name>), and allow the user to select the site where the phone will be replaced.
 - Refer to (GET) All Sites Belonging to the Customer
- 3. Resolve <Customer Hierarchy> and <Site Hierarchy>.
 - <Customer Hierarchy> is the entry in the earlier step that ends with the <Customer Name>.
 - For example, if <Customer Name> is Innovia, the <Customer Hierarchy> will be sys.hcs.CS-P. CS-NB.Innovia.
 - <Site Hierarchy> is the entry in the earlier step that the operator selects.
 - For example, sys.hcs.CS-P.CS-NB.Innovia.INV-Reading

Step 2: Populate a list of existing phones at the site

- 1. Fetch all phones currently available to the customer to populate a list of existing phones (existing_phone) at the site.
 - Refer to (GET) Phone Models
- 2. User select the MAC address of the existing phone that must be replaced (<old_phone_MAC_Address>).

Step 3: Provide replacement phone details

In this step the user fills out the details of the replacement phone:

1. Users fills out the replacement phone MAC address in replacement_phone, and the value is resolved to <new_phone_MAC_Address>.

Note: Note the input conditions for the MAC address in the OpenAPI example for

2. Fetch the available phone models to populate replacement_model.

Refer to (GET) Phone Models.

Note: Depending on how Automate is set, fetch either all phone models currently available to the customer, or fetch all phone models currently offered to customers by the Provider.

3. Fetch the phone protocols that the replacement phone model supports, to populate protocol.

Pass new_phone_model in the GET query.

Refer to (GET) Supported Protocols.

4. Fetch all available phone button templates for the phone model to populate pbt.

Refer to (GET) Phone Button Templates for Phone Model

5. Fetch available security profiles for the replacement phone model to populate security_profile.

Refer to (GET) Security Profiles for Phone Model

6. User fills out a phone description for replacement_description.

Query parameters

| Parameter | Value |
|-----------|-------|
| hierarchy | Site |

Request Payload (Body)

The box lists all parameters that could be included in the call request. These parameters are described in the table below the box:

```
"existing_phone": "<old_phone_MAC_Address>",
    "replacement_phone": "<new_phone_MAC_Address>",
    "replacement_model": "<new_phone_model>",
    "protocol": "<new_phone_protocol>",
    "pbt": "<new_phone_PBT>",
    "security_profile": "<new_phone_SecProfile>",
    "replacement_description": "<new_phone_Description>",
    "request_meta": {
```

(continues on next page)

(continued from previous page)

```
"external_id": "<external-id>",
    "external_reference": "<external_)reference>",
    "callback_url": "<callback_url_or_ip",
    "callback_username": "callback_username",
    "callback_password": "callback_password"
    }
}</pre>
```

The table describes the parameters in the request:

| Parameter | Description | Туре | Notes |
|-------------------|-----------------------------|--------|--|
| existing_phone | Existing phone name. | string | The MAC address of the existing phone, the phone to be replaced. |
| replacement_phone | Replacement phone name. | string | The MAC address of the replacement phone. |
| replacement_model | Replacement phone model. | string | Choose from existing phone models available. |
| protocol | The phone protocol. | string | The phone protocols that the replacement phone model supports. |
| pbt | The phone button template. | string | The phone button templates that are available in the system for the specified replacement phone model. |
| security_profile | The phone security profile. | string | The phone security profile for the replacement phone model. |
| replacement_descr | New phone description. | string | A phone description for the new, replacement |
| request_meta | Callback details. | object | These details enable VOSS Automate to update the status when the initiated transaction is complete. |

9.2.6. Associate an existing Cisco device or device profile to subscriber

Overview

This API POST call associates a standalone phone (Cisco device) or standalone Cisco Unified Device Profile (UDP) to a subscriber.

POST https://<hostname>/api/api/view/GS_AddDeviceToUser_VIEW

References:

- OpenAPI example for view/GS AddDeviceToUser VIEW
- Model: view/GS_AddDeviceToUser_VIEW
- API Reference for view/GS_AddDeviceToUser_VIEW

Using POST GS_AddDeviceToUser_VIEW

Associating an existing device or UDP to an existing subscriber involves the following tasks:

- 1. Identify the customer and customer hierarchy, and the site and site hierarchy.
- 2. Populate a list of users to which the Cisco device or UDP can be associated.
- Assign the unassociated Cisco device or UDP.

Step 1: Identify Customer+Customer Hierarchy and Site+Site Hierarchy

- Fetch the list of customers to populate a drop-down list, and allow the user to select a customer from the list. <Customer Name>
 - Refer to (GET) Customers (for deployments with or without HCM-F).
- 2. Fetch available site hierarchies for the selected customer (<Customer Name>), and allow the user to select the relevant site.
 - Refer to (GET) All Sites Belonging to the Customer
- Resolve <Customer Hierarchy> and <Site Hierarchy>.
 - <Customer Hierarchy> is the entry in the earlier step that ends with the <Customer Name>.
 For example, if <Customer Name> is Innovia, the <Customer Hierarchy> will be sys.hcs.CS-P. CS-NB.Innovia.
 - \bullet <Site Hierarchy> is the entry in the earlier step that the operator selects.
 - For example, sys.hcs.CS-P.CS-NB.Innovia.INV-Reading

Step 2: Retrieve users and choose a user

- Populate the list of existing users at the site, displaying username, firstname, and lastname.
 Refer to (GET) Subscriber PKID and Name, passing the site hierarchy (<Site Hierarchy>).
- 2. User selects one user from the list, and resolve the choice to <username>.

Step 3: Assign unassociated Cisco device or UDP

- 1. The form provides two radio buttons. The user selects one option, either Device or Device Profile:
 - If user selects "Device":
 - a. For newDeviceType, assign the value phone for <device_or_udp>
 - b. Use (GET) All Phones Without Associated User to fetch all unassociated devices at the site.
 - c. User selects one device (phone) at newDeviceName, and the selected value is resolved to <device_or_udp_name>.
 - If user selects "Device Profile":
 - a. For newDeviceType, assign the value deviceProfile to <device_or_udp>
 - b. Use (GET) All DeviceProfiles Without Associated User to fetch all unassociated device profiles at the site.
 - c. Users selects a device profile at newDeviceName, and the selected value is resolved to <device_or_udp_name>.

Query parameters

| Parameter | Value |
|-----------|-------|
| hierarchy | Site |

Request Payload (Body)

The box lists all parameters that could be included in the call request. These parameters are described in the table below the box:

```
{
   "username": "<username>",
   "newDeviceType": "<device_or_udp>",
   "newDeviceName": "<device_or_udp_name>",
   "request_meta": {
   "external_id": "<external-id>",
   "external_reference": "<external_)reference>",
   "callback_url": "<callback_url_or_ip",
   "callback_username": "<callback_username>",
   "callback_password": "<callback_password>"
   }
}
```

| Parameter | Description | Туре | Notes |
|---------------|-------------------|--------|---|
| username | The username. | string | |
| newDeviceType | The device type. | string | Device type, either Cisco device (phone), or Cisco UDP (device profile). |
| newDeviceName | The device name. | string | The name of an unassociated device or unassociated device profile name |
| request_meta | Callback details. | object | These details enable VOSS Automate to update the status when the initiated transaction is complete. |

9.2.7. Disassociate a Cisco phone from a subscriber

Overview

This API POST call removes a subscriber-phone association to make it an unassigned (standalone) Cisco phone (device).

POST https://<hostname>/api/api/view/GS_removeDeviceFromUser_VIEW

References:

- OpenAPI example for view/GS removeDeviceFromUser VIEW
- Model: GS_removeDeviceFromUser_VIEW
- API Reference for GS removeDeviceFromUser VIEW

Using POST GS_removeDeviceFromUser_VIEW

Replacing a Cisco phone involves the following tasks:

- 1. Identify the customer and customer hierarchy, and the site and site hierarchy.
- 2. Identify the user and device to disassociate.

Step 1: Identify Customer+Customer Hierarchy and Site+Site Hierarchy

- 1. Fetch the list of customers to populate a drop-down list, and allow the user to select a customer from the list. <Customer Name>
 - Refer to (GET) Customers (for deployments with or without HCM-F).
- 2. Fetch available site hierarchies for the selected customer (<Customer Name>), and allow the user to select the relevant site.
 - Refer to (GET) All Sites Belonging to the Customer
- 3. Resolve <Customer Hierarchy> and <Site Hierarchy>.

- <Customer Hierarchy> is the entry in the earlier step that ends with the <Customer Name>.
 For example, if <Customer Name> is Innovia, the <Customer Hierarchy> will be sys.hcs.CS-P. CS-NB.Innovia.
- <Site Hierarchy> is the entry in the earlier step that the operator selects.
 For example, sys.hcs.CS-P.CS-NB.Innovia.INV-Reading

Step 2: Identify the user and device to disassociate

1. Fetch users to populate the list of users for username.

Refer to (GET) Subscriber PKID and Name

Note: Hide the PKID. Display only the following, for username: username, first name, last name

- 2. User selects a username. Resolve the value to <username>.
- 3. Fetch all phones associated to the selected user to populate oldDeviceName.

 Refer to (GET) All Phones Belonging to a Subscriber
- 4. Users selects the phone to be unassigned. Resolve the chosen value to <MAC_Address>.

Request Payload (Body)

The box lists all parameters that could be included in the call request. These parameters are described in the table below the box:

```
{
  "username": "<username>",
  "oldDeviceName": "<MAC_Address>",
  "request_meta": {
  "external_id": "<external-id>",
  "external_reference": "<external_)reference>",
  "callback_url": "<callback_url_or_ip",
  "callback_username": "<callback_username>",
  "callback_password": "<callback_password>"
  }
}
```

| Parameter | Description | Туре | Notes |
|---------------|-------------------------|--------|---|
| username | The username. | string | |
| oldDeviceName | Associated device name. | string | The name of the device you're removing. |
| request_meta | Callback details. | object | These details enable VOSS Automate to update the status when the initiated transaction is complete. |

9.2.8. Move a Cisco subscriber between sites

Overview

This API POST call moves a Cisco subscriber (and their services and devices) between sites, creates one or more new lines during the move, and assigns the new lines to the devices/services.

POST https://<hostname>/api/api/view/UserPhoneMoveUsers_VIEW

References:

- OpenAPI example for view/UserPhoneMoveUsers_VIEW
- Model: view/UserPhoneMoveUsers VIEW
- API Reference for view/UserPhoneMoveUsers_VIEW

Using POST UserPhoneMoveUsers_VIEW

Moving a subscriber and their services/devices involves the following tasks:

- 1. Identify the customer and customer hierarchy.
- 2. Identify the subscriber to be moved, as well as their devices and/or services.
- 3. Choose the target site.
- 4. Define whether new lines will be assigned in the target site, or whether to move existing lines.
- 5. Define whether new phones will be assigned in the target site (with the profile moved from the existing phone), and/or whether to move existing phones belonging to the subscriber.
- 6. Allocate the default CUC template defined in the site defaults.
- 7. Hardcode values in the payload.

Step 1: Identify Customer+Customer Hierarchy

 Fetch the list of customers to populate a drop-down, and allow the user to select a customer from the list. <Customer Name>

Refer to (GET) Customers (for deployments with or without HCM-F).

2. Fetch available site hierarchies for the selected customer (<Customer Name>).

Refer to (GET) All Sites Belonging to the Customer

3. Resolve < Customer Hierarchy>.

<Customer Hierarchy> is the entry in the earlier step that ends with the <Customer Name>.

For example, if <Customer Name> is Innovia, the <Customer Hierarchy> will be sys.hcs.CS-P.CS-NB. Innovia.

Step 2: Identify the subscriber to be moved

In this step, identify the subscriber to be moved, as well as their associated devices and/or services.

1. Populate a list of usernames, and allow the user to select one user (<username>).

Refer to (GET) Subscriber PKID and Name

Note: Hide the PKID. Display only the username, firstname, and lastname in the form.

- 2. Use (GET) Subscriber's Phones and Services to fetch the details of all the selected subscriber's phones, lines, and services.
- 3. Segregate and collate the data into the following read-only GUI fields:
 - · "Existing Phones"
 - · "Existing DeviceProfiles"
 - · "Existing Voicemail"
 - · "Existing SNR"
- 4. Populate the read-only field, "Current Site", with value collected from step 3, and assign the value to <move_from_hn>.

Step 3: Choose the target site

1. Fetch the customer's sites and populate the values in move_to_hn ("Move to Site").

Refer to (GET) Available Hierarchies of a Customer

2. User selects a target site, and the value is assigned to <move_to_hn>, for example, sys.hcs.CS-P. CS-NB.Innovia.INV-Reading.

Step 4: Add new lines or move existing lines

In this step, decide whether to assign new lines in the target site, or whether to move the subscriber's existing lines.

- Define whether to move lines to the target site, via the form checkbox titled "Move Line" (<move_line_trueFalse>).
- 2. Define whether to allocate new lines in the target site when the subscriber is moved, via the checkbox titled "Allocate New Line(s)" <new_line_truefalse>.
 - If "Move Line" and "Allocate New Line(s)" are selected (value: true), the system attempts to move existing lines to the target site and also creates new lines (one or more) in the target site, and adds it to the device and/or Extension Mobility.

When <new_line_truefalse> = true:

- Fetch all directory numbers currently available at this site. The user can select one value <dn>. See tool-macro-directory-numbers-id.
- Form text field titled "Line Label" line_label>.
- Form text field titled "Display" line_display>.

Step 5: Add new phones or move existing phones

In this step, define whether to assign new phones in the target site (with the profile moved from the existing phone), or whether to move existing phones belonging to the subscriber.

- 1. To move desk phones, select the "Move Deskphone(s)" checkbox, setting the value for <move_deskphone_truefalse> to True. The default is False.
- 2. To create new desk phones, select the "Create new Deskphone" checkbox, setting the value for <add_new_phone_at_target_truefalse> to True. The default is False.
- 3. If <add_new_phone_at_target_truefalse> = True, choose an option, and follow the relevant steps:
 - Option 1: Use existing phone's config:
 - a. Select the "Use Existing Phone config" checkbox, setting the value for <copy_deskphoneprofile_to_target_truefalse> to True. The default is False.
 - b. Populate the "Configuration of existing Phone to be used" drop-down with all phones currently belonging to the subscriber. See (GET) Subscriber's Phones and Services
 - c. User selects one phone (<phone_mac_address_at_source>).
 - d. Process the payload returned by the GET call.
 - e. Resolve the value at for field "existingPhones", and display it in the drop-down.
 - f. Depending on operation selection, assign the following:
 - <phone_mac_address_at_source>
 - <phone_type_at_source>
 - Option 2: Don't use existing phone's config:
 - a. Leave the "Use Existing Phone config" checkbox clear, setting the value for <copy_deskphoneprofile_to_target_truefalse> to False. The default is False.
 - b. Set <phone_mac_address_at_source> to null.
 - c. Assign phone model in target site by fetching available phone models in the platform.
 - d. Populate the drop-down titled "Phone Model in target site" (<phone_type_at_target>).

Note: The GET call you use depends on how Automate is set up, either all phone models available to the customer, or all phone models the provider makes available to the customer.

Refer to (GET) Phone Models

4. Fill out the MAC Address of the phone in the target site in a text field (name), and resolve the value to <new_phone_MAC_Address>.

Note: Note the input conditions for the MAC address at OpenAPI example for view/UserPhoneMoveUsers_VIEW

Step 6: Allocate the default CUC template defined in the site defaults

1. Execute the following GET request to allocate the default CUC template from the Site Defaults:

```
GET https://servername/api/tool/Macro/?hierarchy=<move_to_hn>&method=evaluate&

→format=json&input={%23 data.SiteDefaultsDoc.defaultcucsubscribertemplate ||

→direction:local %23}
```

Example:

```
GET https://servername/api/tool/Macro/?hierarchy=sys.hcs.CS-P.CS-NB.Innovia.INV-

→Reading&method=evaluate&format=json&input={%23 data.SiteDefaultsDoc.

→defaultcucsubscribertemplate || direction:local %23}
```

2. Assign the value returned from the GET call, to <default_vm_template>.

Note: You will only need to include <default_vm_template> in the payload if the user being moved to the other site has voicemail.

Step 7: Hardcode values in the payload

- 1. Hardcode the following values in the payload:
 - Set AllowLineMove to true (<move_line_truefalse>)
 - Set default css to true
 - Set default_dp to true

Query parameters

| Parameter | Value |
|-----------|----------|
| hierarchy | Customer |

Request Payload (Body)

The box lists all parameters that could be included in the call request. These parameters are described in the table below the box:

```
"username": "<username>",
    "move_from_hn": "<move_from_hn>",
    "move_to_hn": "<move_to_hn>",
    "move_line": <move_line_truefalse>,
    "AllowLineMove": <move_line_truefalse>,
    "new_line": <new_line_truefalse>,
    "lines": [
```

(continues on next page)

(continued from previous page)

```

| Parameter | Description | Туре | Notes |
|--------------------|--|---------|---|
| username | The username. | string | |
| move_from_hn | Source site. | string | The name of the site where you're moving the subscriber from. |
| move_to_hn | Target site. | string | The name of the site where you're moving the subscriber to. |
| move_line | Whether line move is allowed. | boolean | Defines whether existing lines need to be moved to the new site. True or False. Default is False. |
| AllowLineMove | Whether to move lines. | boolean | True or False. Default is False. |
| new_line | Whether to allocate new lines. | boolean | Defines whether to allocate new lines in the target site when moving the subscriber. Default is True. |
| lines | Line details. | array | For each line you add, the directory number, the line label, and the line display name. |
| move_phone | Whether to move the phone. | boolean | True or False. |
| new_phone | Whether to add a new phone. | boolean | True or False. |
| new_phone_from_so | Whether to create a new phone from existing phone. | boolean | True or False. |
| new_phone_config_s | Type of phone. | string | The source phone type. |
| new_phone_config_s | Configuration source. | string | New phone's configuration source. |
| phone_type | The phone type. | string | Phone type at target site. |
| name | The phone name | string | The MAC address of the phone. Max value: 15 characters The first 3 characters must be SEP Following the first 3 characters, the next 12 characters must consist of hexadecimal characters. |
| AllowLineMove | Whether to include lines in the move. | string | True or False. |
| newCucUserTemplate | Default CUC template. | string | This value is defined in the Site Defaults. |
| default_dp | | boolean | Hardcode this value to True. |
| default_css | The CSS | boolean | Hardcode this value to True. |
| request_meta | Callback details. | string | These details enable VOSS Automate to update the status when the initiated transaction is complete. |

9.2.9. Modify line data

Overview

This API PATCH call updates the following device line information:

- · Line description
- · Line alerting name
- · Line alerting name ASCII

PATCH https://<hostname>/api/api/device/cucm/Line/{Line PKID}

Where {Line PKID} is the ID of the line to update.

References:

- OpenAPI example for device/cucm/Line/{Line PKID}
- · Model: device/cucm/Line
- API Reference for device/cucm/Line

Using device/cucm/Line/{Line PKID}

Using this API call involves the following tasks:

- 1. Identify the customer and the customer's hierarchy, and the site and the site hierarchy.
- 2. Resolve the line that needs to be modified, and modify line details, as required.

Step 1: Identify Customer+Customer Hierarchy and Site+Site Hierarchy

1. Fetch the list of customers to populate a drop-down list, and allow the user to select a customer from the list. <Customer Name>

Refer to (GET) Customers (for deployments with or without HCM-F).

2. Fetch available site hierarchies for the selected customer (<Customer Name>), and allow the user to select the relevant site.

Refer to (GET) All Sites Belonging to the Customer

- 3. Resolve <Customer Hierarchy> and <Site Hierarchy>.
 - <Customer Hierarchy> is the entry in the earlier step that ends with the <Customer Name>.

For example, if <Customer Name> is Innovia, the <Customer Hierarchy> will be sys.hcs.CS-P. CS-NB.Innovia.

<Site Hierarchy> is the entry in the earlier step that the operator selects.

For example, sys.hcs.CS-P.CS-NB.Innovia.INV-Reading

Step 2: Resolve the line that needs to be modified, and modify line details

- 1. Fetch the following line details from Automate, and present this data in separate fields:
 - Line record PKID
 - · Line Pattern
 - · Line Description
 - · Line AlertingName
 - · Line ASCIIAlerting Name

Refer to (GET) All Line Details

- 2. User selects a line, and for the selected line, resolve the value to <Line PKID>.
- 3. For the selected line, the user can modify the following details to update the line:
 - A line description, at description, resolved to <Line Description Text>.
 - A line alerting name, at alertingName, resolved to <Line Alerting Text>
 - A line ASCII alerting name, at asciiAlertingName, resolved to <Line Alerting ASCII Text>

Note: Note the input conditions for these fields, at OpenAPI Example

Query parameters

| Parameter | Value |
|-----------|-------|
| hierarchy | Site |

Request Payload (Body)

The box lists all parameters that could be included in the call request. These parameters are described in the table below the box:

```
"description": "<Line Description Text>",
   "alertingName": "<Line Alerting Text>",
   "asciiAlertingName": "<Line Alerting ASCII Text",
   "request_meta": {
        "external_id": "<id>",
        "external_reference": "<Reference>",
        "callback_url": "<url_string>",
        "callback_username": "<callback_username>",
        "callback_password": "<callback_password>"
}
```

| Parameter | Description | Туре | Notes |
|-------------------|---------------------------|--------|---|
| description | Line description. | string | Max 30 characters. |
| alertingName | Line alerting name. | string | Max 30 characters. |
| asciiAlertingName | Line alerting ASCII name. | | Max 30 characters. |
| request_meta | Callback details. | string | These details enable VOSS Automate to update the status when the initiated transaction is complete. |

9.2.10. Modify phone data - line recording details

Overview

This API PATCH call updates the following phone information:

- · Phone description
- · Line label
- · Line display name
- · Line ASCII display name
- · Line call recording settings

PATCH https://<hostname>/api/api/device/cucm/Phone/{Phone PKID}

Where {Phone PKID} is the ID of the phone to update.

References:

- OpenAPI example for device/cucm/Phone/{Phone PKID}
- Model: device/cucm/Phone
- API Reference for device/cucm/Phone

Using device/cucm/Phone/{Phone PKID}

Using this API call involves the following tasks:

- 1. Identify the customer and the customer's hierarchy, and the site and the site hierarchy.
- 2. Resolve the phone that needs to be modified, and modify phone details, as required.

Step 1: Identify Customer+Customer Hierarchy and Site+Site Hierarchy

 Fetch the list of customers to populate a drop-down list, and allow the user to select a customer from the list. <Customer Name>

Refer to (GET) Customers (for deployments with or without HCM-F).

2. Fetch available site hierarchies for the selected customer (<Customer Name>), and allow the user to select the relevant site.

Refer to (GET) All Sites Belonging to the Customer

- 3. Resolve <Customer Hierarchy> and <Site Hierarchy>.
 - <Customer Hierarchy> is the entry in the earlier step that ends with the <Customer Name>.

For example, if <Customer Name> is Innovia, the <Customer Hierarchy> will be sys.hcs.CS-P. CS-NB.Innovia.

<Site Hierarchy> is the entry in the earlier step that the operator selects.

For example, sys.hcs.CS-P.CS-NB.Innovia.INV-Reading

Step 2: Resolve the phone that needs to be modified, and modify phone details

- 1. Fetch the following phone details from Automate, and present this data in separate fields:
 - · Phone PKID
 - · Phone MAC Address
 - · Phone Description
 - · Phone Line Label
 - · Phone Display Name
 - · Phone ASCII Display Name

Refer to (GET) All Phones Belonging to a Customer (with PKIDs)

Note: You can ignore other values, such as Call Recording fields.

- 2. User selects a phone, and for the selected phone, resolve the value to <Phone PKID>.
- 3. For the selected phone, the user can modify the following details to update the phone:

Note: Depending on the number of lines that the phone returns, the form needs to dynamically populate fields relevant to lines.

- <Phone Description>
- <Line (n) Label>
- <Line (n) Display>
- <Line (n) DisplayAscii>

For example:

<Phone Description>

```
• <Line 1 Label>
```

- <Line 1 Display>
- <Line 1 DisplayAscii>
- <Line 2 Label>
- <Line 2 Display>
- <Line 2 DisplayAscii>

Query parameters

| Parameter | Value |
|-----------|-------|
| hierarchy | Site |

Request Payload (Body)

The box lists all parameters that could be included in the call request. These parameters are described in the table below the box:

```
Г
{
   "op": "add",
   "path": "/request_meta",
   "value": [
      {
            "external_id": "<id>",
            "external_reference": "<Reference>".
            "callback_url": "<url_string>",
            "callback_username": "<callback_username>",
            "callback_password": "<callback_password>"
      }
]
},
{"op": "replace","path": "/description","value": "<Phone Description>" },
{"op": "replace","path": "/lines/line/0/label","value": "<Line 1 Label>" },
{"op": "replace", "path": "/lines/line/0/display", "value": "<Line 1 Display>" },
{"op": "replace", "path": "/lines/line/0/displayAscii", "value": "<Line 1 DisplayAscii>" },
{"op": "replace","path": "/lines/line/1/label","value": "<Line 2 Label>" },
{"op": "replace","path": "/lines/line/1/display","value": "<Line 2 Display>" },
{"op": "replace", "path": "/lines/line/1/displayAscii", "value": "<Line 2 DisplayAscii>" }
]
```

| Parameter | Description | Туре | Notes |
|--------------|-------------------|------------------|---|
| ор | | string | |
| path | | string | |
| value | | array of objects | |
| request_meta | Callback details. | object | These details enable VOSS Automate to update the status when the initiated transaction is complete. |

9.2.11. Delete a phone

Overview

This API DELETE call deletes a phone.

DELETE https://<hostname>/api/api/relation/SubscriberPhone/{Removal_Phone_PKID}

Where {Removal_Phone_PKID} is the ID of the phone to delete.

References:

- OpenAPI example for relation/SubscriberPhone/{Removal_Phone_PKID}
- Model: relation/SubscriberPhone
- API Reference for relation/SubscriberPhone

Using relation/SubscriberPhone/{Removal_Phone_PKID}

Using this API call involves the following tasks:

- 1. Identify the customer and the customer's hierarchy.
- 2. Fetch all details of the phone to be deleted.

Step 1: Identify Customer+Customer Hierarchy

1. Fetch the list of customers to populate a drop-down list, and allow the user to select a customer from the list. <Customer Name>

Refer to (GET) Customers (for deployments with or without HCM-F).

2. Fetch available hierarchies for the selected customer (<Customer Name>).

Refer to (GET) All Sites Belonging to the Customer

- Resolve < Customer Hierarchy>.
 - <Customer Hierarchy> is the entry in the earlier step that ends with the <Customer Name>.

For example, if <Customer Name> is Innovia, the <Customer Hierarchy> will be sys.hcs.CS-P. CS-NB.Innovia.

Step 2: Fetch all details of the phone to be deleted

- 1. Execute tool-macro-all-phones-belonging-to-the-customer-id (at Customer hierarchy) to fetch all phones belonging to the customer.
- 2. User selects the phone to be deleted.
- 3. Resolve the phone PKID of the selected phone, to <Removal_Phone_PKID>

Note: There is no callback for DELETE. You will need to execute a GET call containing data from the payload to confirm the status of the call, for example:

GET https://<hostname>/api/tool/Transaction/9095e5a2-6b62-45f8-abbb-93bd908a8bef/

See the response sample output for this DELETE call in the OpenAPI example for relation/SubscriberPhone/{Removal_Phone_PKID}

9.2.12. Delete a subscriber

Overview

This API DELETE call deletes a subscriber.

DELETE https://<hostname>/api/api/relation/Subscriber/{Deletion Subscriber PKID}

Where {Deletion Subscriber PKID} is the ID of the subscriber to delete.

References:

- OpenAPI example for relation/Subscriber/{Deletion Subscriber PKID}
- Model: relation/Subscriber
- · API Reference for relation/Subscriber

Using relation/SubscriberPhone/{Removal_Phone_PKID}

Using this API call involves the following tasks:

- 1. Identify the customer and the customer's hierarchy.
- 2. Fetch all details of the subscriber to be deleted.

Step 1: Identify Customer+Customer Hierarchy

1. Fetch the list of customers to populate a drop-down list, and allow the user to select a customer from the list. <Customer Name>

Refer to (GET) Customers (for deployments with or without HCM-F).

2. Fetch available hierarchies for the selected customer (<Customer Name>).

Refer to (GET) All Sites Belonging to the Customer

Resolve <Customer Hierarchy>.

<Customer Hierarchy> is the entry in the earlier step that ends with the <Customer Name>.
 For example, if <Customer Name> is Innovia, the <Customer Hierarchy> will be sys.hcs.CS-P. CS-NB.Innovia.

Step 2: Fetch all details of the subscriber to be deleted

- 1. Execute *(GET) Subscriber PKID and Name* to fetch the following details of all subscribers at the customer's hierarchy, and populate the drop-down:
 - UserID
 - FirstName
 - LastName
- 2. User selects the subscriber to be deleted.
- 3. Resolve the subscriber PKID of the selected subscriber, to <Deletion Subscriber PKID>

Note: There is no callback for DELETE. You will need to execute a GET call containing data from the payload to confirm the status of the call, for example:

GET https://<hostname>/api/tool/Transaction/b471aa05-01d5-46c9-981e-685774b645be/

See the response sample output for this DELETE call in the OpenAPI example for relation/SubscriberPhone/ $\{Removal_Phone_PKID\}$
